

**SUPERFUND'S 25TH ANNIVERSARY:
Hundreds of Toxic Waste Sites Continue to Threaten
Health and Water Supplies**

In Fiscal Year 2003, the Environmental Protection Agency (EPA) developed new indicators to gauge progress in the Superfund program. EPA cleanup officials at Superfund sites must report annually and more frequently if warranted, on the potential for human exposure to Superfund site contamination and on whether groundwater pollution at the site is under control. The EPA's own data show that hundreds of Superfund sites pose threats to people's health and the safety of groundwater supplies.

When the EPA designates a Superfund site as "human exposure not under control," it means that contamination has been detected at a site at an unsafe level, and the possibility exists that humans may come into contact with the contamination, and the contamination has not been treated, stabilized, or contained well enough to prevent human exposure to contamination. A site will be designated as "Human Exposure Not Under Control," when the following site conditions are met:

- contaminant levels in media (soil, surface water, sediment, air, ground water) do not fall within the category designated as safe by EPA; and
- the possibility exists that humans may come into contact with the contaminated media; and
- the level of contaminants humans would be exposed to by the contaminated media does not fall within levels designated as safe by EPA.¹

The EPA reports that human exposure is not under control at 149 final and proposed Superfund sites. These sites are listed by state in Appendix A.² At another 158 final and proposed Superfund sites, EPA has insufficient data to determine if human exposure is under control. These sites are listed by state in Appendix B.³

¹ U.S. EPA website. http://www.epa.gov/superfund/accomp/ei/ei_faqs.pdf.

² U.S. EPA website. <http://cfpub1.epa.gov/supercpad/cursites/srchrslt.cfm?start=1&CFID=17672657&CFTOKEN=27456904>. Searched December 1, 2005.

³ U.S. EPA website. <http://cfpub1.epa.gov/supercpad/cursites/srchrslt.cfm?start=1&CFID=17672657&CFTOKEN=27456904>. Searched December 1, 2005.

The EPA's second indicator concerns migration of polluted groundwater from the site. When the EPA designates a Superfund site as "migration of groundwater pollution not under control," it means that:

Tests show that the ground water is contaminated, and one of the following four circumstances are met:

- if the ground water has been stabilized to prevent the spread of contamination, but ground water and surface water has not yet been monitored to insure that contamination has not spread; or
- if the migration of the contaminated ground water has not been stabilized to prevent spreading; or
- if migration has been stabilized to prevent spreading and the ground water has been found to be draining into and contaminating a surface water body; or
- if migration has been stabilized to prevent spreading, and the ground water has been found to be draining into, but not contaminated a surface water body, but there are no plans to monitor the ground water and surface water to insure that contamination has not spread.⁴

The EPA reports that migration of groundwater pollution is not under control at 226 final and proposed Superfund sites. These sites are listed by state in Appendix C.⁵ At another 224 final and proposed Superfund sites, EPA has insufficient data to determine if migration of groundwater pollution is under control. These sites are listed by state in Appendix D⁶

The EPA's human exposure and groundwater pollution indicators strongly demonstrate the need for additional funding to protect people's health and our water supplies from near-term threats. At best, however, these are only interim indicators of program achievement. Controlling human exposure might be accomplished simply by creating a barrier between people and the contamination. Paving a contaminated site with asphalt and putting a fence around a Superfund site might serve to control some exposure. However, paving over a dangerous problem does not mean the site is cleaned up. Containing contamination is not an acceptable substitute for site cleanup. CERCLA includes a preference for permanent treatment of contamination and restoration of important groundwater resources, not just limiting exposure or containing pollution. The Bush administration's failure to attain even these initial protections – and refusal to support the polluter-pays principle – demonstrates the dangerous, real-world impacts of the administration's priorities and policies.
