Course Description

This course is concerned with decision-making by small numbers of economic agents whose fates are intertwined. That is, each agent only partially determines his or her own fate. The other agents also have an influence. For example, the profits achieved by a firm depend not only on its own decisions, but also on those of its competitors. Similarly, the outcome of international trade depends on the trade policies of all trading parties. What outcomes might occur in such situations? This course is primarily about game theory, which presents standard tools for economists to analyse such questions.

We will first consider a theory of decision-making by a single agent who faces an uncertain future. We will see how certain axioms lead to the expected utility model of behavior. We will briefly consider alternatives to expected utility.

The remainder of the course will be concerned with non-cooperative behavior between two or more agents. By non-cooperative, we mean that each agent chooses a strategy independently of the other agents, trying to maximize his or her own payoff. This will involve considerations of dominated strategies and of Nash equilibrium and its refinements. We will discuss repeated games and games with incomplete information.

Course Requirements

You must have taken Econ 7030 and be familiar with probability before taking this course. Logical thinking will help you to understand the various new concepts to which you will be introduced.

Your grade will be based on two exams, homework and a project. I encourage you to discuss the homework with other students; but you must write your answers individually. The project is to answer a double or triple starred question of your choice from a chapter in Fudenberg and Tirole which we do not cover in class. The weights are as follows:

<table>
<thead>
<tr>
<th>Component</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Homework</td>
<td>25%</td>
</tr>
<tr>
<td>Midterm</td>
<td>25%</td>
</tr>
<tr>
<td>Project</td>
<td>10%</td>
</tr>
<tr>
<td>Final</td>
<td>40%</td>
</tr>
</tbody>
</table>

COURSE OUTLINE (Chapter numbers: K=Kreps FT=Fudenberg & Tirole)

Choice under Uncertainty (K 3)

Games in Strategic Form and Nash Equilibrium (FT 1)

Dominance and Rationalizability (FT 2.1)

Extensive Form Games (FT 3)

Multi-Stage Games with Observed Actions (FT 4.1 - 4.4, 5.1)

Bayesian Games and Bayesian Equilibrium (FT 6)
