Indoor Air Quality in Immigrant Housing in Commerce City, CO

Shannon Simons
August 10, 2006

Motivation for the Study

- Indoor air has not been studied as thoroughly as outdoor air
- Not much research has been done on the living conditions of immigrants
- If Hispanic immigrants live in substandard housing, then what effect does this have on air quality?
What Are We Doing?

- Commerce City is very industrial with heavy vehicle traffic
- Comparing health effects with indoor and outdoor air quality
- Also comparing the relationship between indoor and outdoor air

HUD Healthy Homes

- 250 homes are being inspected and surveyed by UCHSC
- 100 of these homes will receive air and vacuum sampling
- Air samples analyzed for PM$_{2.5}$ with 24-hour CO and CO$_2$ monitoring
- Vacuum samples analyzed for allergens
Allergens

- Allergic asthmatics are sensitized to specific allergens
- Subsequent exposure to allergens can trigger asthma attacks
- Young children most at risk for developing allergic asthma [2]

Carbon Monoxide

- Result of combustion
- Fastens to red blood cells and prevents them from carrying oxygen
- Vision, ability to work and learn, and ability to physically function can be impaired
- Acute exposure can be fatal
- 15 PPM average over 8 hours or 22 PPM average over 1 hour is acceptable [3]
Particulate Matter

- Particles suspended in the air
- Dust, dirt, soot, smoke, and liquid droplets [4]
- Breathing can be impaired, asthma aggravated, and immune system can be weakened
- Can also transport bacteria, viruses, and toxins [2]

Particulate Matter con’t

- Long term exposure linked to reduced lung function, chronic bronchitis, and premature death
- PM$_{2.5}$ main concern in this study because they can become lodged in the lungs easily
- Suitable level is less than 65 ug/m$^3$ in a 24 hour period [5]
ELISA

- Enzyme-linked immunosorbent assays
- Once the allergen standard has reacted with the antibodies, the samples (which have reacted with the same antibodies) are compared to the standard
- The plate is read in an optical density machine
- Calibration curves are made from the allergen standard
Difficulties with Indoor Air Assessments

- Confounding factors: PM$_{2.5}$ and allergens can both exacerbate asthma
- Quantitatively describing allergen concentrations
- Carperting acts as an allergen reservoir, but does not represent personal exposure.
- Dust mites and feline allergens found in most homes, even if they do not have cats

Results

- About half of the homes are complete
- Have not found many dangerous levels
- Have only sampled a few homes with wheezing or asthmatic children, so we cannot draw any conclusions yet
- No correlation between PM$_{2.5}$ concentrations and CO
- Suggested correlation between PM concentrations and CO$_2$
- ELISA analysis is still pending
Indoor and Outdoor PM2.5 Concentrations

Indoor versus Outdoor PM$_{2.5}$ Concentration (ug/m$^3$)
Average PM$_{2.5}$ Concentrations

Indoor PM$_{2.5}$ Concentration vs Indoor CO$_2$

R Squared = 0.3716
Conclusions

- Much research is being performed on similar subjects
- This particular project will continue through December 2006
- ELISA analysis will be performed and the families will be notified of the results
