

1. (28 points) The following problems are not related.

- (a) Find the general antiderivative of  $g(x) = \frac{e^{\sqrt{x}}}{\sqrt{x}}$ .
- (b) Use logarithmic differentiation to find the derivative of  $y = (x^4 + 1)^x$ . *You do not need to simplify your answer.*
- (c) Find the derivative of  $f(x) = \int_0^{\cos(x)} \sqrt{1+t^3} dt$ .

**Solution:**

- (a) Setting  $u = \sqrt{x}$  implies that  $2du = \frac{dx}{\sqrt{x}}$ , so

$$\int \frac{e^{\sqrt{x}}}{\sqrt{x}} dx = 2 \int e^u du = 2e^u + C = 2e^{\sqrt{x}} + C.$$

- (b) Taking logarithms yields

$$\ln(y) = x \ln(x^4 + 1),$$

and differentiating with respect to  $x$  gives

$$\frac{1}{y} \frac{dy}{dx} = \ln(x^4 + 1) + \frac{4x^4}{x^4 + 1}.$$

Solving for  $dy/dx$  in terms of  $x$  gives

$$\frac{dy}{dx} = (x^4 + 1)^x \left( \ln(x^4 + 1) + \frac{4x^4}{x^4 + 1} \right).$$

- (c)  $f'(x) = -\sin(x)\sqrt{1+\cos^3(x)}$ .

2. (26 points) The following problems are not related:

- (a) Find the derivative of  $f(x) = \ln(\tan^{-1}(x))$ .
- (b) Evaluate the definite integral  $\int_0^{\ln(3)} \sinh(x) \cosh(x) dx$ , and fully simplify your answer.
- (c) Determine the value of the limit  $\lim_{x \rightarrow 0^+} x^2 \ln(x^2)$ .

**Solution:**

$$(a) f'(x) = \left( \frac{1}{1+x^2} \right) \left( \frac{1}{\tan^{-1}(x)} \right)$$

(b) Making  $u = \sinh(x)$  implies that  $du = \cosh(x)dx$ , and the bounds become

$$\begin{aligned} u(0) &= \sinh(0) = 0 \\ u(\ln(3)) &= \sinh(\ln(3)) = \frac{1}{2} \left( e^{\ln(3)} - e^{-\ln(3)} \right) = \frac{1}{2} \left( 3 - \frac{1}{3} \right) = \frac{4}{3}. \end{aligned}$$

Evaluating the integral:

$$\begin{aligned} \int_0^{\ln(3)} \sinh(x) \cosh(x) dx &= \int_0^{4/3} u du \\ &= \frac{1}{2} u^2 \Big|_0^{4/3} \\ &= \frac{1}{2} \left( \frac{4}{3} \right)^2 \\ &= \frac{8}{9}. \end{aligned}$$

(c) The limit yields the indeterminate form  $0 \cdot (-\infty)$ , so we apply L'Hôpital's rule:

$$\begin{aligned} \lim_{x \rightarrow 0^+} x^2 \ln(x^2) &= \lim_{x \rightarrow 0^+} \frac{\ln(x^2)}{1/x^2} \\ &\stackrel{LH}{=} \lim_{x \rightarrow 0^+} \frac{2x/x^2}{-2/x^3} \\ &= \lim_{x \rightarrow 0^+} \left( \frac{2}{x} \right) \left( -\frac{x^3}{2} \right) \\ &= - \lim_{x \rightarrow 0^+} x^2 \\ &= 0. \end{aligned}$$

3. (16 points) Find the area of the largest rectangle which is symmetric around the  $y$ -axis, bounded below by the  $x$ -axis, and which has two corners touching the graph of  $f(x) = \frac{1}{1+x^2}$ . Fully justify your answer by using an appropriate test.

**Solution:**

Let  $x$  be the coordinate at the edge of the rectangle. Then the width is  $2x$ , and the height is  $\frac{1}{1+x^2}$ . Hence, the area is

$$A(x) = \frac{2x}{1+x^2}.$$

The derivative is given by

$$A'(x) = \frac{2(1+x^2) - (2x)(2x)}{(1+x^2)^2} = \frac{2-2x^2}{(1+x^2)^2},$$

which has domain  $(-\infty, \infty)$ . Hence, the critical values satisfy

$$0 = A'(x) \implies 0 = 2 - 2x^2 \implies x = \pm 1.$$

Since  $x = -1$  yields a negative area, we use the first derivative test on  $x = 1$ .

$$A'(0) = \frac{2 - 2(0^2)}{(1 + 0^2)^2} > 0$$

$$A'(2) = \frac{2 - 2(2^2)}{(1 + 2^2)^2} < 0.$$

By the first derivative test,  $x = 1$  yields a maximum area, which is

$$A(1) = \frac{2(1)}{1+1^2} = 1.$$

4. (18 points) A bug flying in a straight line starts decelerating at time  $t = 0$  at a constant rate of  $1 \text{ ft/s}^2$  for 5 seconds. Answer the following questions about the bug over the time interval  $0 \leq t \leq 5$ .

- Find the bug's velocity as a function of time, given that its velocity at  $t = 0$  is  $2 \text{ ft/s}$ .
- What is the bug's displacement over the time interval  $0 \leq t \leq 5$ ?
- The bug changes direction at least once during the 5 seconds. What is the total distance the bug travels over the time interval  $0 \leq t \leq 5$ ?

**Solution:**

- (a) Since  $a(t) = -1$  and  $v(0) = 2$ , integrating  $a(t)$  yields  $v(t) = -t + 2$ .
- (b) Integrating  $v(t)$  and using the fact that  $s(0) = 0$  yields  $s(t) = -\frac{1}{2}t^2 + 2t$ . Hence, the total displacement is  $s(5) = -\frac{5}{2}$  feet.
- (c) Note that the bug changes direction when  $0 = v(t) = -t + 2$ , so at  $t = 2$ . For  $t < 2$ , the velocity is positive, and for  $t > 2$ , the velocity is negative. Thus, the total distance  $D$  is given by

$$\begin{aligned}
 D &= \int_0^5 |v(t)| dt \\
 &= \int_0^2 v(t) dt - \int_2^5 v(t) dt \\
 &= (s(2) - s(0)) - (s(5) - s(2)) \\
 &= 2s(2) - s(5) - s(0) \\
 &= 4 - \left(-\frac{5}{2}\right) - 0 \\
 &= \frac{13}{2},
 \end{aligned}$$

so the bug travels a total of  $13/2 = 6.5$  feet.

Hence, but

5. (12 points) For what value of  $a$  is the following function continuous?

$$f(x) = \begin{cases} 2x^2 - x + a, & x \leq 0 \\ \frac{x}{2 \sin(x)}, & x > 0 \end{cases}$$

Justify your answer with appropriate computations.

**Solution:**

For  $f(x)$  to be continuous, we need

$$\lim_{x \rightarrow 0^-} f(x) = f(0) = \lim_{x \rightarrow 0^+} f(x).$$

Since  $x^2 - x + a$  is a polynomial, it is continuous for any choice of  $a$ ; hence,  $f(x)$  is continuous at 0 from the left. We only need to choose  $a$  so that

$$a = f(0) = \lim_{x \rightarrow 0^+} \frac{x}{2 \sin(x)} = \frac{1}{2} \left( \lim_{x \rightarrow 0^+} \frac{\sin(x)}{x} \right)^{-1} = \frac{1}{2} (1)^{-1} = \frac{1}{2}.$$

6. (18 points) Consider the function

$$g(x) = \arctan(x) + \frac{1}{x^2 - 4}$$

- (a) Find the domain of the function, and give your answer in interval notation.  
 (b) Find all horizontal asymptotes of  $g(x)$ , and justify your answer with limits.

**Solution:**

- (a) The domain of  $\arctan(x)$  is  $(-\infty, \infty)$ , and the domain of  $\frac{1}{x^2 - 4}$  is  $(-\infty, -2) \cup (-2, 2) \cup (2, \infty)$ .  
 Hence, the domain of  $g(x)$  is also given by

$$(-\infty, -2) \cup (-2, 2) \cup (2, \infty).$$

(b)

$$\begin{aligned} \lim_{x \rightarrow \pm\infty} g(x) &= \lim_{x \rightarrow \pm\infty} \left( \arctan(x) + \frac{1}{x^2 - 4} \right) \\ &= \lim_{x \rightarrow \pm\infty} \arctan(x) + \underbrace{\lim_{x \rightarrow \pm\infty} \frac{1}{x^2 - 4}}_{=0} \\ &= \pm \frac{\pi}{2}. \end{aligned}$$

Therefore,  $g(x)$  has horizontal asymptotes at  $\frac{\pi}{2}$  (when  $x \rightarrow \infty$ ) and  $-\frac{\pi}{2}$  (when  $x \rightarrow -\infty$ ).

7. (16 points) The half-life of the chemical element cobalt-56 is approximately 77 days. Suppose we have a 10 milligram sample of cobalt-56..

- (a) Find a formula for the mass of cobalt-56 remaining after  $t$  days.  
 (b) How long will it take for only 1 milligram of cobalt-56 to remain in the sample? *It is OK for your answer to have a logarithm in it.*

**Solution:**

- (a) Suppose that  $m(t)$  is the mass of cobalt-56 remaining after  $t$  days. Using the law of natural decay, we know that

$$m(t) = 10e^{kt},$$

so we need to solve for the constant  $k$ . Using the information about the half-life we have

$$5 = 10e^{k(77)} \implies \frac{1}{2} = e^{77k} \implies \ln(1/2) = 77k \implies k = \frac{\ln(1/2)}{77}.$$

Hence, the following formulas for  $m(t)$  are all valid:

$$\begin{aligned} m(t) &= 10e^{(\ln(1/2)/77)t} \\ &= 10 \left( \frac{1}{2} \right)^{t/77} \\ &= 10e^{-(\ln(2)/77)t} \\ &= 10(2)^{-t/77}. \end{aligned}$$

(b) A single milligram of cobalt-56 will remain when

$$1 = 10 \left( \frac{1}{2} \right)^{t/77} \implies \frac{\ln(1/10)}{\ln(1/2)} = \frac{t}{77} \implies t = \frac{-77 \ln(10)}{-\ln(2)} \implies t = \frac{77 \ln(10)}{\ln(2)}$$

This time is approximately 255.79 days.

8. (16 points) For each of the following questions, give a short justification for your answer.

- (a) If  $f(x)$  is an odd function and  $\int_{-3}^0 f(x) dx = \pi + 1$ , find  $\int_{-3}^3 f(x) dx$ .
- (b) Find the absolute minimum of the function  $f(x) = x \cdot 2^x$ , if it exists.
- (c) Evaluate the limit  $\lim_{h \rightarrow 0} \frac{\arctan(3x + 3h) - \arctan(3x)}{h}$ .
- (d) Suppose that  $f(x)$  is differentiable everywhere, with  $f(-1) = 1$  and  $f(1) = 3$ . Is there some value  $c$  such that  $f'(c) = 1$ ?

**Solution:**

- (a) The integral is 0. Since  $f(x)$  is an odd function, it is a known fact that

$$\int_{-a}^a f(x) dx = 0,$$

which is true in particular for  $a = 3$ .

- (b) The minimum value of  $f(x)$  is given by

$$\left( -\frac{1}{\ln(2)} \right) \left( 2^{-1/\ln(2)} \right).$$

This is because

$$f'(x) = 2^x(1 + \ln(2)x) = 0$$

has a solution at  $x = -1/\ln(2)$ , which is the only critical value for  $f(x)$ . Also,

$$f''(x) = \ln(2)2^x(2 + \ln(2)x),$$

which is positive at  $x = -1/\ln(2)$ , which is thus a minimum for the function.

- (c) The limit is  $\frac{3}{1 + 9x^2}$ . There are at least two ways to evaluate this limit. The first is to notice that the expression is the derivative of  $y = \arctan(3x)$ , which we know to be  $\frac{3}{1 + 9x^2}$  using the chain rule and the derivative formula for  $\arctan$ .

Alternatively, the limit has the indeterminate form  $\frac{0}{0}$ , so we can use L'Hôpital's rule:

$$\lim_{h \rightarrow 0} \frac{\arctan(3x + 3h) - \arctan(3x)}{h} \stackrel{LH}{=} \lim_{h \rightarrow 0} \frac{\frac{3}{1 + (3x + 3h)^2} - 0}{1} = \frac{3}{1 + 9x^2}.$$

- (d) Yes, there is such a  $c$ . Since  $f(x)$  is differentiable everywhere, it is also continuous everywhere, and hence satisfies the Mean Value Theorem in particular on  $[-1, 1]$ . This means there is a  $c \in (-1, 1)$  such that

$$f'(c) = \frac{f(1) - f(-1)}{1 - (-1)} = \frac{3 - 1}{2} = 1.$$
