

Lectures on topological order:

Long range entanglement and topological excitations

Xiao-Gang Wen, Boulder summer school

2016/8

Local quantum systems and gapped quantum systems

- A **local quantum system** is described by (\mathcal{V}_N, H_N)

\mathcal{V}_N : a Hilbert space with a tensor structure $\mathcal{V}_N = \bigotimes_{i=1}^N \mathcal{V}_i$

H_N : a local Hamiltonian acting on \mathcal{V}_N :

$$H_N = \sum \hat{O}_{ij}$$

- A ground state is not a single state in \mathcal{V}_N , but a subspace

$$\Psi_{\text{grnd space}} \subset \mathcal{V}_N.$$

Local quantum systems and gapped quantum systems

- A **local quantum system** is described by (\mathcal{V}_N, H_N)

\mathcal{V}_N : a Hilbert space with a tensor structure $\mathcal{V}_N = \otimes_{i=1}^N \mathcal{V}_i$

H_N : a local Hamiltonian acting on \mathcal{V}_N :

$$H_N = \sum \hat{O}_{ij}$$

- A ground state is not a single state in \mathcal{V}_N , but a subspace

$$\Psi_{\text{grnd space}} \subset \mathcal{V}_N.$$

- A **gapped quantum system** (a concept for $N \rightarrow \infty$ limit):
 $\{(\mathcal{V}_{N_1}, H_{N_1}); (\mathcal{V}_{N_2}, H_{N_2}); (\mathcal{V}_{N_3}, H_{N_3}); \dots\}$ with gapped spectrum.
- A gapped quantum system is not a single Hamiltonian, but a sequence of Hamiltonian with larger and larger sizes.

A gapped (ie short-range correlated) quantum phase

- **A gapped state** is a sequence of ground subspaces: $\Psi_{N_1}, \Psi_{N_2}, \dots$
- **A gapped quantum phase** is an equivalent class of local unitary (LU) transformation of gapped states

$$|\Psi(1)\rangle = P\left(e^{-i T \int_0^1 dg H(g)}\right) |\Psi(0)\rangle$$

$$= \text{[Diagram of a brickwork lattice of yellow squares]} |\Psi(0)\rangle$$

where $H(g) = \sum_i O_i$ is local.

Hastings-Wen [cond-mat/0503554](#); Bravyi-Hastings-Michalakis [arXiv:1001.0344](#)

Chen-Gu-Wen [arXiv:1004.3835](#)

$$\begin{aligned} &\Psi_{N_1}, \Psi_{N_2}, \Psi_{N_3}, \Psi_{N_4}, \dots \\ &\Psi'_{N_1}, \Psi'_{N_2}, \Psi'_{N_3}, \Psi'_{N_4}, \dots \end{aligned}$$

$$\begin{array}{cccc} \Psi_{N_1} & \Psi_{N_2} & \Psi_{N_3} & \Psi_{N_4} \\ \updownarrow LU & \updownarrow LU & \updownarrow LU & \updownarrow LU \\ \Psi'_{N_1} & \Psi'_{N_2} & \Psi'_{N_3} & \Psi'_{N_4} \end{array}$$

- OK definition with translation symmetry, since there is natural way $N_i \rightarrow N_{i+1}$. Not OK without translation symmetry.

A gapped (short-range correlated) quantum **liquid** phase

- A gapped quantum **liquid** phase:

$$\Psi_{N_1}, \Psi_{N_2}, \Psi_{N_3}, \Psi_{N_4}, \dots$$

$$\Psi'_{N_1}, \Psi'_{N_2}, \Psi'_{N_3}, \Psi'_{N_4}, \dots$$

$$N_{k+1} = sN_k, \quad s \sim 2$$

- $\Psi_{N_{i+1}} \stackrel{LA}{\sim} \Psi_{N_i} \otimes \Psi_{N_{i+1}-N_i}^{dp}$. Generalized local unitary (gLU) trans.

where

$$\Psi_N^{dp} = \bigotimes_{i=1}^N |\uparrow\rangle$$

Zeng-Wen arXiv:1406.5090

A gapped (short-range correlated) quantum **liquid** phase

- A gapped quantum **liquid** phase:

$$\Psi_{N_1}, \Psi_{N_2}, \Psi_{N_3}, \Psi_{N_4}, \dots$$

$$\Psi'_{N_1}, \Psi'_{N_2}, \Psi'_{N_3}, \Psi'_{N_4}, \dots$$

$$N_{k+1} = sN_k, \quad s \sim 2$$

- $\Psi_{N_{i+1}} \stackrel{LA}{\sim} \Psi_{N_i} \otimes \Psi_{N_{i+1}-N_i}^{dp}$. Generalized local unitary (gLU) trans.

where

$$\Psi_N^{dp} = \bigotimes_{i=1}^N |\uparrow\rangle$$

Zeng-Wen arXiv:1406.5090

- gLU transformations allow us to take the thermal dynamical limit ($N_k \rightarrow \infty$ limit) without translation symmetry.

Example of gapped quantum liquid: topological order

For gapped systems with no symmetry:

- According to Landau theory, no symm. to break
→ all systems belong to one trivial phase

Example of gapped quantum liquid: topological order

For gapped systems with no symmetry:

- According to Landau theory, no symm. to break
→ all systems belong to one trivial phase
- Thinking about entanglement: there are
 - long range entangled (LRE) states
 - short range entangled (SRE) states

Chen-Gu-Wen arXiv:1004.3835

$$|\text{LRE}\rangle \neq \text{[diagram of a 3x3 grid of yellow squares with black outlines]} |\text{product state}\rangle = |\text{SRE}\rangle$$

Example of gapped quantum liquid: topological order

For gapped systems with no symmetry:

- According to Landau theory, no symm. to break
→ all systems belong to one trivial phase
- Thinking about entanglement: there are [Chen-Gu-Wen arXiv:1004.3835](#)
 - **long range entangled (LRE) states** → many phases
 - **short range entangled (SRE) states** → one phase

$$|\text{LRE}\rangle \neq |\text{product state}\rangle = |\text{SRE}\rangle$$

- All SRE states belong to the same trivial phase
- LRE states can belong to many different phases: different **patterns of long-range entanglements** defined by LU trans.
= different **topological orders** [Wen PRB 40 7387 \(89\)](#)

Examples of gapped quantum non-liquid states

- Stacking 2+1D FQH states \rightarrow gapped quantum state, but not liquids.
- Layered $\nu = 1/m$ FQH state:
Ground state degeneracy can be $GSD = m^{L_z}, m, m^2$

periodic

1-twisted

2-twisted

- Haah's cubic code on 3D cubic lattice:

$$H = - \sum_{\text{cubes}} (G^Z + G^X),$$

Jeongwan Haah, Phys. Rev. A 83, 042330 (2011) arXiv:1101.1962

More exotic long-range entanglement

- Topo. order = gapped quantum **liquid** Zeng-Wen14; Swingle-McGreevy14
 - gauge theory
 - Fermi statistics
 - quantum field theory
 - MERA rep. Vidal 06

More exotic long-range entanglement

- Topo. order = gapped quantum **liquid** Zeng-Wen14; Swingle-McGreevy14

→ gauge theory
→ Fermi statistics
→ quantum field theory
→ MERA rep. Vidal 06

- **s-source** entanglement structure

- Quantum liquid has $s = 1$
- 3D layered FQH: $s = 2$
- d+1D Fermi liquid: $s = \frac{2^d}{2}$
- no MERA rep.

More exotic long-range entanglement

- Topo. order = gapped quantum **liquid** Zeng-Wen14; Swingle-McGreevy14

→ gauge theory
→ Fermi statistics
→ quantum field theory
→ MERA rep. Vidal 06

- **s-source** entanglement structure

- Quantum liquid has $s = 1$
- 3D layered FQH: $s = 2$
- d+1D Fermi liquid: $s = \frac{2^d}{2}$
- no MERA rep.

- Haah's cubic code
- no MERA rep.
- No quantum field theory description

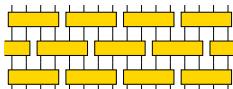

Many-body entanglement goes beyond quantum field theory.

Bosonic/fermionic gapped quantum liquid phases

Both local bosonic and fermionic systems have the following local property: $\mathcal{V}_{\text{tot}} = \otimes_i \mathcal{V}_i$

Gu-Wang-Wen arXiv:1010.1517

$$H' \sim U H U^\dagger, \quad U =$$

- Bosonic liquid phases are defined by gLU trans. $U = \prod U_{ijk}$:
 - $[U_{ijk}, U_{i'j'k'}] = 0$
 - U_{ijk} acts within $V_i \otimes V_j \otimes V_k$. e.g. $U_{ijk} = e^{i(b_i b_j b_k^\dagger + \text{h.c.})}$
- Fermionic liquid phases are defined by gLU trans. $U^f = \prod U_{ijk}^f$:
 - $[U_{ijk}^f, U_{i'j'k'}^f] = 0$, but U_{ijk}^f may not act within $V_i \otimes V_j \otimes V_k$. e.g. $U_{ijk}^f = e^{i(t_{ij} c_i c_j + \text{h.c.})}$, where $c_i = \sigma_i^x \prod_{j < i} \sigma_j^z$

Gapped quantum liquids for bosons and fermions have very different mathematical structures

Examples of topological orders (before 2000)

- $\Psi(z_1, z_2, \dots) = 1 \rightarrow$ equal amplitude superposition of all particle configurations \rightarrow A product state = superfluid state

$$|\psi\rangle = \sum_{\text{all conf.}} \left| \begin{array}{c} \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \end{array} \right\rangle = \otimes_z (|0\rangle_z + |1\rangle_z + \dots)$$

Examples of topological orders (before 2000)

- $\Psi(z_1, z_2, \dots) = 1 \rightarrow$ equal amplitude superposition of all particle configurations \rightarrow A product state = superfluid state 

$$|\psi\rangle = \sum_{\text{all conf.}} \left| \begin{array}{c} \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \end{array} \right\rangle = \otimes_z(|0\rangle_z + |1\rangle_z + \dots)$$

- **Examples:** 1) scramble the phases

Laughlin 83

$$\Psi_{FQH}^{\nu=1/2}(z_1, z_2 \cdots) = \left[\prod (z_i - z_j) e^{-\frac{1}{4} \sum |z_i|^2} \right]^2 = [\chi_1(z_i)]^2,$$

Examples of topological orders (before 2000)

- $\Psi(z_1, z_2, \dots) = 1 \rightarrow$ equal amplitude superposition of all particle configurations \rightarrow A product state = superfluid state 

$$|\psi\rangle = \sum_{\text{all conf.}} \left| \begin{array}{c} \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \\ \bullet \end{array} \right\rangle = \otimes_z (|0\rangle_z + |1\rangle_z + \dots)$$

- **Examples:** 1) scramble the phases

Laughlin 83

$$\Psi_{FQH}^{\nu=1/2}(z_1, z_2 \cdots) = \left[\prod (z_i - z_j) e^{-\frac{1}{4} \sum |z_i|^2} \right]^2 = [\chi_1(z_i)]^2,$$

- **II)** Put $\nu = 1$ state of spin-up(down) electrons $\chi_1(z_i^\uparrow)\chi_1(z_i^\downarrow)$ on lattice, with one electron per site \rightarrow Chiral spin liquid

Kalmeyer-Laughlin PRL **59** 2095 (87), Wen-Wilczek-Zee PRB **39** 11413 (89)

Examples of topological orders (before 2000)

Why Laughlin states have topological order?

K -matrix states (generalize Laughlin states):

$$\psi_K = \prod_{i < j; l} (z_i^l - z_j^l)^{K_{ll}} \prod_{i, j; l < J} (z_i^l - z_j^J)^{K_{lJ}} e^{-\frac{1}{4} \sum |z_i^l|^2}$$

- Quasiparticle excitations are labeled by integer vectors **\mathbf{m}**

$$\psi_\xi = \prod_{i; l} (\xi - z_i^l)^{\mathbf{m}_l} \psi_K,$$

- If **\mathbf{m}** is the l_0^{th} column of $K \rightarrow \psi_\xi$ describe a missing hole in the l_0^{th} layer, which is a local excitation (not fractionalized).
- Topological excitation is labeled by **\mathbf{m}** mod columns of K .
Number of topo. exc. = $\det(K)$.

Why Laughlin states have topological order?

K -matrix states (generalize Laughlin states):

$$\Psi_K = \prod_{i < j; l} (z_i^l - z_j^l)^{K_{ll}} \prod_{i, j; l < J} (z_i^l - z_j^l)^{K_{lj}} e^{-\frac{1}{4} \sum |z_i^l|^2}$$

- Quasiparticle excitations are labeled by integer vectors **\mathbf{m}**

$$\Psi_\xi = \prod_{i; l} (\xi - z_i^l)^{\mathbf{m}_l} \Psi_K, \quad \mathcal{L} = \frac{K_{IJ}}{4\pi} a_{I\mu} \partial_\nu a_{J\lambda} \epsilon^{\mu\nu\lambda} + \mathbf{m}_I \delta(\xi - x) a_{I0}$$

- If **\mathbf{m}** is the l_0^{th} column of **K** $\rightarrow \Psi_\xi$ describe a missing hole in the l_0^{th} layer, which is a local excitation (not fractionalized).
- Topological excitation is labeled by **\mathbf{m}** mod columns of **K** .
Number of topo. exc. = **$\det(K)$** . Statistics: $\theta_{\mathbf{m}} = \pi \mathbf{m}^T K^{-1} \mathbf{m}$.

Why Laughlin states have topological order?

K-matrix states (generalize Laughlin states):

$$\Psi_K = \prod_{i < j; I} (z_i^I - z_j^I)^{K_{II}} \prod_{i, j; I < J} (z_i^I - z_j^J)^{K_{IJ}} e^{-\frac{1}{4} \sum |z_i^I|^2}$$

- Quasiparticle excitations are labeled by integer vectors **m**

$$\Psi_\xi = \prod_{i; I} (\xi - z_i^I)^{\mathbf{m}_I} \Psi_K, \quad \mathcal{L} = \frac{K_{IJ}}{4\pi} a_{I\mu} \partial_\nu a_{J\lambda} \epsilon^{\mu\nu\lambda} + \mathbf{m}_I \delta(\xi - x) a_{I0}$$

- If **m** is the I_0^{th} column of $K \rightarrow \Psi_\xi$ describe a missing hole in the I_0^{th} layer, which is a local excitation (not fractionalized).
- Topological excitation is labeled by **m** mod columns of K .
Number of topo. exc. = $\det(K)$. Statistics: $\theta_{\mathbf{m}} = \pi \mathbf{m}^T K^{-1} \mathbf{m}$.

K-matrix classification of abelian topological order

- Even K -matrix (all K_{II} are even) classify all 2+1D Abelian topological orders (in a many-to-one way) in local bosonic systems.
- Odd K -matrix (one of the K_{II} is odd) classify all 2+1D Abelian topological orders (in a many-to-one way) in local fermionic systems.

Wen-Zee PRB 46 2290 (92)

Why is the state $[\chi_k(z_i)]^2$ a non-Abelian QH state?

where $\chi_k(z_1, \dots, z_N)$ is the IQH wave function of k filled Landau levels.

- What kind of non-Abelian state?
- What is its effective theory and edge excitations?

Why is the state $[\chi_k(z_i)]^2 = \chi_k(z_i^{(1)})\chi_k(z_i^{(2)})|_{z_i^{(1)}=z_i^{(2)}}$ a non-Abelian QH state?

where $\chi_k(z_1, \dots, z_N)$ is the IQH wave function of k filled Landau levels.

- What kind of non-Abelian state?
- What is its effective theory and edge excitations?

Projective construction:

Split an electron into partons and glue them back together

$$\Phi(z_1, \dots, z_N) = [\chi_k(z_1, \dots, z_N)]^n = P[\chi_k(z_1^{(1)}, \dots) \chi_k(z_1^{(2)}, \dots) \cdots]$$

electron \rightarrow n -partons, a^{th} -kind partons $z_i^{(a)}$ form $\nu = k$ IQH χ_k

- Effective theory of independent partons

$$H = \frac{1}{2m} \psi_I^\dagger (\partial - iA)^2 \psi_I, \quad I = 1, \dots, n$$

- Many-body wave function $\Phi(z_i) = \langle 0 | \prod \psi_e(z_i) | \chi_k \cdots \chi_k \rangle$

The electron operator $\psi_e = \psi_1 \cdots \psi_n$ is $SU(n)$ singlet,
if ψ_I form an fundamental representation of $SU(n)$.

- Introduce $SU(n)$ gauge field to glue partons back to electrons:

$$H = \frac{1}{2m} \psi_I^\dagger (\partial - iA\delta_{IJ} - ia_{IJ})^2 \psi_J$$

- Effective theory is obtained by integrating out the gapped parton fields:

$$\mathcal{L} = \frac{k}{4\pi} \text{Tr}(a_\mu \partial_\nu a_\lambda + \frac{2}{3} a_\mu a_\nu a_\lambda) \epsilon^{\mu\nu\lambda}$$

$SU(n)_k^f$ CS theory. (Level $k = 1$ $SU(n)_k^f$ CS theory is abelian.)

Quasiparticle excitations in $[\chi_k(z_i)]^2 = \chi_k(z_i^\uparrow)\chi_k(z_i^\downarrow)|_{z_i^\uparrow=z_i^\downarrow}$

Consider the $[\chi_k(z_i)]^2$ state: $SU(2)_k^f$ Chern-Simons theory

- A charge $q = 1$ hole can be split into two \rightarrow two charge $q = 1/2$ quasiparticles.

- The number of four-quasiparticle states: project to $SU(2)$ singlet.

$$\frac{1}{2} \otimes \frac{1}{2} \otimes \frac{1}{2} \otimes \frac{1}{2} = (0 \oplus 1) \otimes (0 \oplus 1) = 0 \oplus 1 \oplus 1 \oplus (0 \oplus 1 \oplus 2)$$

But $SU(2)_k^f$ state has
no quasiparticle with spin $s > \frac{k}{2}$

Quasiparticle excitations in $[\chi_k(z_i)]^2 = \chi_k(z_i^\uparrow)\chi_k(z_i^\downarrow)|_{z_i^\uparrow=z_i^\downarrow}$

Consider the $[\chi_k(z_i)]^2$ state: $SU(2)_k^f$ Chern-Simons theory

- A charge $q = 1$ hole can be split into two \rightarrow two charge $q = 1/2$ quasiparticles.

- The number of four-quasiparticle states: project to $SU(2)$ singlet.

$$\frac{1}{2} \otimes \frac{1}{2} \otimes \frac{1}{2} \otimes \frac{1}{2} = (0 \oplus 1) \otimes (0 \oplus 1) = 0 \oplus 1 \oplus 1 \oplus (0 \oplus 1 \oplus 2)$$

But $SU(2)_k^f$ state has

no quasiparticle with spin $s > \frac{k}{2}$

Level- k fusion: $s_1 \otimes s_2 = |s_1 - s_2| \oplus \dots \oplus \min(s_1 + s_2, k - s_1 - s_2)$

- Level- $k = 1$: $(\frac{1}{2} \otimes \frac{1}{2}) \otimes (\frac{1}{2} \otimes \frac{1}{2}) = (0) \otimes (0) = 0$
- Level- $k = 2$: $\frac{1}{2} \otimes \frac{1}{2} \otimes \frac{1}{2} \otimes \frac{1}{2} = (0 \oplus 1) \otimes (0 \oplus 1) = 0 \oplus 1 \oplus 1 \oplus (0)$

Edge excitations in $[\chi_k(z_i)]^n$ state: $U(1) \times SU(k)_n$ CFT

- Edge state: Independent partons \rightarrow filled Landau levels

$$\mathcal{L} = \psi_{\alpha a}^\dagger (\partial_t - v \partial_x) \psi_{\alpha a},$$

$$\alpha = 1, \dots, n,$$

$$a = 1, \dots, k$$

- Excitations are generated by (a, a^\dagger generate exc. in an oscillator)

$$U(1) : J = \psi_{\alpha a}^\dagger \psi_{\alpha a}, \quad \rightarrow U(1) \text{ Kac-Moody algebra CFT}$$

$$SU(k) : J^m = \psi_{\alpha a}^\dagger T_{ab}^m \psi_{\alpha b}, \quad \rightarrow SU(k)_n \text{ Kac-Moody algebra CFT}$$

$$SU(n) : j^I = \psi_{\alpha a}^\dagger S_{\alpha\beta}^I \psi_{\beta a}, \quad \rightarrow SU(n)_k \text{ Kac-Moody algebra CFT}$$

- Glue partons back to electrons = remove the $SU(n)$ excitations.
- Edge excitations are generated by

$$U(1) : J = \psi_{\alpha a}^\dagger \psi_{\alpha a},$$

$$SU(k) : J^m = \psi_{\alpha a}^\dagger T_{ab}^m \psi_{\alpha b}$$

$$\text{Edge CFT: } U(1) \times SU(k)_n \text{ Kac-Moody algebra } c = 1 + \frac{n(k^2-1)}{n+k}.$$

- Bulk effective theory $SU(n)_k^f$ CS theory

Another example $\mathcal{S}[\prod (z_i - z_j)^2 \prod (w_i - w_j)^2]$

- Consider with two partons ψ_1, ψ_2 , each fills the first Landau level.
 $\rightarrow \nu = 1/2$ Laughlin state $\prod (z_i - z_j)^2 = \langle 0 | \prod \psi_1(z_i) \psi_2(z_i) | \chi_1 \chi_1 \rangle$

- Now start with four partons $\psi_1, \psi_2, \psi_3, \psi_4$, each fills the first Landau level:

$$\prod (z_i - z_j)^2 \prod (w_i - w_j)^2 = \langle 0 | \prod \psi_1(z_i) \psi_2(z_i) \prod \psi_3(w_i) \psi_4(w_i) | \chi_1 \chi_1 \chi_1 \chi_1 \rangle$$

- $\mathcal{S}[\prod (z_i - z_j)^2 \prod (w_i - w_j)^2] = \langle 0 | \prod \psi_e(Z_i) | \chi_1 \chi_1 \chi_1 \chi_1 \rangle$

where $\psi_e(Z_i) = \psi_1(Z_i) \psi_2(Z_i) + \psi_3(Z_i) \psi_4(Z_i)$.

- Under $SO(8)$ trans. between $(\text{Re}\psi_i, \text{Im}\psi_i)$, ψ_e is an $SO(5)$ singlet

- Effective theory** $H = \psi_i^\dagger (\partial - A\delta_{ij} - a_{ij})^2 \psi_j \rightarrow SO(5)$ CS theory

- Edge states:**

Wen cond-mat/9811111

Independent partons \rightarrow 4 Dirac fermions = 8 Majorana fermions

After projection \rightarrow 8-5 chiral Majorana fermions.

- $\mathcal{S}[\prod (z_i - z_j)^2 \prod (w_i - w_j)^2]$ is the bosonic Pfaffian state.

$$\Psi_{S(220)} = \mathcal{S}[\prod (z_i - z_j)^2 \prod (w_i - w_j)^2] = \mathcal{A}[\frac{1}{z_1 - z_2} \frac{1}{z_3 - z_4} \cdots] \prod (z_i - z_j)$$

Moore-Read NPB 360 362 (91); Rezayi-Wen-Read arXiv:1004.2563

How to realize non-Abelian QH states in experiments?

Wen cond-mat/9908394; Rezayi-Wen-Read arXiv:1004.2563

nnm bi-layer state with no interlayer tunneling

- (nnm) state

$$\Phi_{nnm} = \prod (z_i - z_j)^n (w_i - w_j)^n (z_i - w_i)^m e^{-\frac{1}{4} \sum |z_i|^2 + |w_i|^2}$$

where $n = \text{odd}$ for fermionic electron and $n = \text{even}$ for bosonic “electron”.

- (nnm) state $\sim (n - m, n - m, 0)$ state: $\Phi_{nnm} = \chi_1^m \Phi_{n-m, n-m, 0}$
Will consider only $(nn0)$ state.
 $(220) \sim (331)$ state with $\nu = 1/2$ and (330) with $\nu = 2/3$
- Intralayer repulsion $V_{\text{intra}} = 1$, increase interlayer repulsion

Two possibilities

Interlayer-exciton = charge $-\frac{1}{n}$ quasiparticle in one layer + charge $\frac{1}{n}$ quasihole in the other layer

- Interlayer-exciton condensation at $\mathbf{k} \neq 0$

- Interlayer-exciton condensation at $\mathbf{k} = 0$

Why 2e-Laughlin state? – Hierarchical construction

- $(nn0)$ is described by $U(1) \times U(1)$ CS theory

$$\mathcal{L} = \frac{1}{4\pi} a_{I\mu} \partial_\nu a_{J\lambda} K^{IJ} \epsilon^{\mu\nu\lambda}, \quad I, J = 1, 2, \quad K = \begin{pmatrix} n & 0 \\ 0 & n \end{pmatrix}$$

- The interlayer exciton (with statistics $\theta = 2\pi/n$) is described by

$$\mathcal{L} = \frac{1}{4\pi} a_I \partial a_J K^{IJ} + \mathbf{m}^I a_{I\mu} j^\mu(x), \quad \mathbf{m} = \begin{pmatrix} 1 \\ -1 \end{pmatrix};$$

- Exciton condensation $\mathcal{L} = (j^0)^2 - \mathbf{j}^2$ with $\partial_\mu j^\mu = 0$: $j^\mu = \frac{\partial_\nu \tilde{a}_\lambda}{2\pi} \epsilon^{\mu\nu\lambda}$

$$\mathcal{L} = \frac{1}{4\pi} a_I \partial a_J K^{IJ} + \frac{1}{2\pi} \mathbf{m}^I a_I \partial \tilde{a} + \frac{1}{8\pi^2 \chi} (\tilde{B}^2 - \frac{1}{v_s^2} \tilde{\mathbf{E}}^2)$$

- \rightarrow new FQH state:

$$K_{\text{new}} = \begin{pmatrix} K & \mathbf{m} \\ \mathbf{m}^T & 0 \end{pmatrix} = \begin{pmatrix} n & 0 & 1 \\ 0 & n & -1 \\ 1 & -1 & 0 \end{pmatrix} = W \begin{pmatrix} 2n & 0 & 0 \\ 0 & n\%2 & 1 \\ 0 & 1 & 0 \end{pmatrix} W^T \sim (2n)$$

K and $K' = WKW^T$, $W \in SL(\kappa, \mathbb{Z})$, describe the same FQH state.

- New state is $\nu^* = 1/2n$ Laughlin state of charge-2e electron pairs.

Critical theory for quantum phase transition

- Start with GL theory for excitons and anti-excitons:

$$\mathcal{L} = |\partial_\mu \phi|^2 + \alpha |\phi|^2 + \beta |\phi|^4$$

$\alpha = 0$ at the transition.

- GL-CS theory to reproduce statistics $\theta = 2\pi/n$

$$\mathcal{L} = |(\partial - ia_1 + ia_2)\phi|^2 + \alpha |\phi|^2 + \beta |\phi|^4 + \frac{1}{4\pi} a_I \partial a_J K^{IJ}.$$

- CS term does not destroy the critical point of GL theory, but changes the critical exponents

$(nn0) \rightarrow$ *2e-Laughlin is a continuous transition between two states with the SAME symmetry*

- When $n = 2$, critical theory is massless Dirac fermion

$$\mathcal{L} = \bar{\psi} \gamma^\mu \partial_\mu \psi + m \bar{\psi} \psi$$

$m = 0$ at the transition.

Turn on interlayer tunneling

Effective theory near transition

$$\mathcal{L} = |(\partial - ia_1 + ia_2)\phi|^2 + \alpha|\phi|^2 + \beta|\phi|^4 + (t\phi^n \hat{M} + h.c.) + \frac{1}{4\pi} a_I \partial a_J K^{IJ}.$$

$$\mathcal{L} = \bar{\psi} \gamma^\mu \partial_\mu \psi + m \bar{\psi} \psi + (t \psi^T \psi + h.c.), \quad \text{for } n = 2$$

- When $n = 2$, the $t \psi^T \psi$ term split the massless **Dirac critical point** into two massless **Majorana critical points**.

- Weak $p + ip$ superconductor to strong $p + ip$ superconductor is connected by massless Majorana fermion [Read-Green cond-mat/9906453](https://arxiv.org/abs/cond-mat/9906453)

$$\Psi_{S(220)} = \mathcal{S}[\prod (z_i - z_j)^2 \prod (w_i - w_j)^2] = \mathcal{A}[\frac{1}{z_1 - z_2} \frac{1}{z_3 - z_4} \dots] \prod (z_i - z_j)$$

Projective construction of topo. ordered states on lattice

Consider a spin- $\frac{1}{2}$ system on lattice.

- View spin- \downarrow as zero-boson state and spin- \uparrow as one-boson state
- Split the boson ϕ_i into two fermionic partons $\phi_i = \psi_{i1}\psi_{i2}$, where $\psi_{i\alpha}$ form a 2-dim. rep. of $SU(2)$ and ϕ_i is the $SU(2)$ singlet.

Projective construction of topo. ordered states on lattice

Consider a spin- $\frac{1}{2}$ system on lattice.

- View spin- \downarrow as zero-boson state and spin- \uparrow as one-boson state
- Split the boson ϕ_i into two fermionic partons $\phi_i = \psi_{i1}\psi_{i2}$, where $\psi_{i\alpha}$ form a 2-dim. rep. of $SU(2)$ and ϕ_i is the $SU(2)$ singlet.
- Consider the mean-field ground state of a free parton Hamiltonian

$$H_{\text{mean}} = \sum_{\langle ij \rangle} \psi_i^\dagger u_{ij} \psi_j, \quad u_{ij} = 2 \times 2 \text{ matrix}; \quad \rightarrow \quad |\Psi_{\text{mean}}^{u_{ij}}\rangle$$

Projective construction of topo. ordered states on lattice

Consider a spin- $\frac{1}{2}$ system on lattice.

- View spin- \downarrow as zero-boson state and spin- \uparrow as one-boson state
- Split the boson ϕ_i into two fermionic partons $\phi_i = \psi_{i1}\psi_{i2}$, where $\psi_{i\alpha}$ form a 2-dim. rep. of $SU(2)$ and ϕ_i is the $SU(2)$ singlet.
- Consider the mean-field ground state of a free parton Hamiltonian

$$H_{\text{mean}} = \sum_{\langle ij \rangle} \psi_i^\dagger u_{ij} \psi_j, \quad u_{ij} = 2 \times 2 \text{ matrix}; \quad \rightarrow \quad |\Psi_{\text{mean}}^{u_{ij}}\rangle$$

- Project to physical subspace on each site
 $|\downarrow\rangle = |0\rangle, \quad |\uparrow\rangle = \psi_{i1}^\dagger \psi_{i2}^\dagger |0\rangle$, both $SU(2)$ singlet.

Unphysical states $\psi_{i1}^\dagger |0\rangle, \psi_{i2}^\dagger |0\rangle$ form a $SU(2)$ doublet.

- Project into $SU(2)$ -singlet subspace on each site:

$$|\Psi_{\text{phy}}^{u_{ij}}\rangle = P_{SU(2)} |\Psi_{\text{mean}}^{u_{ij}}\rangle$$

$|\Psi_{\text{phy}}^{u_{ij}}\rangle$ is a trial wave function with variational parameter u_{ij} .

Projective construction of topo. ordered states on lattice

Consider a spin- $\frac{1}{2}$ system on lattice.

- View spin- \downarrow as zero-boson state and spin- \uparrow as one-boson state
- Split the boson ϕ_i into two fermionic partons $\phi_i = \psi_{i1}\psi_{i2}$, where $\psi_{i\alpha}$ form a 2-dim. rep. of $SU(2)$ and ϕ_i is the $SU(2)$ singlet.
- Consider the mean-field ground state of a free parton Hamiltonian

$$H_{\text{mean}} = \sum_{\langle ij \rangle} \psi_i^\dagger u_{ij} \psi_j, \quad u_{ij} = 2 \times 2 \text{ matrix}; \quad \rightarrow \quad |\Psi_{\text{mean}}^{u_{ij}}\rangle$$

- Project to physical subspace on each site
 $|\downarrow\rangle = |0\rangle, \quad |\uparrow\rangle = \psi_{i1}^\dagger \psi_{i2}^\dagger |0\rangle$, both $SU(2)$ singlet.

Unphysical states $\psi_{i1}^\dagger |0\rangle, \psi_{i2}^\dagger |0\rangle$ form a $SU(2)$ doublet.

- Project into $SU(2)$ -singlet subspace on each site:

$$|\Psi_{\text{phy}}^{u_{ij}}\rangle = P_{SU(2)} |\Psi_{\text{mean}}^{u_{ij}}\rangle$$

$|\Psi_{\text{phy}}^{u_{ij}}\rangle$ is a trial wave function with variational parameter u_{ij} .

- *What is the low energy effective theory that describes the low energy excitations above the many-body state $|\Psi_{\text{phy}}\rangle$?*

Lattice partons ψ_i couple to lattice $SU(2)$ gauge field $a_\mu(x)$:

$$H_{\text{eff}} = \sum_{\langle ij \rangle} \psi_i^\dagger u_{ij} e^{i a_{ij}} \psi_j + \sum_i \psi_i^\dagger a_0(i) \psi_i$$

Z_2 topological order

- Choose Read-Sachdev PRL 66, 1773 (91), Wen PRB 44, 2664 (91)

$$u_{i,i+x} = u_{i,i+y} = -\chi\sigma^3, \quad a_0 = c\sigma^1,$$

$$u_{i,i+x+y} = \eta\sigma^1 + \lambda\sigma^2, \quad u_{i,i+x+y} = \eta\sigma^1 - \lambda\sigma^2$$

$H_{\text{eff}} = \sum_{\langle ij \rangle} \psi_i^\dagger u_{ij} \psi_j + \sum_i \psi_i^\dagger a_0 \psi_i$ will be fully gapped.

→ The fermions are all gapped. *The potential gapless excitations may come from the $SU(2)$ gauge fluctuations.*

- a_0 and $SU(2)$ flux $\Phi_i = u_{ij}u_{jk}u_{ki}$ behave like Higgs fields.

$$a_0 \rightarrow U a_0 U^\dagger, \quad \Phi_i \rightarrow U \Phi_i U^\dagger, \quad U \in SU(2).$$

- If they are invariant under the $SU(2)$ transformation → The $SU(2)$ is unbroken → gapless gluon.
- If they are not invariant under the $SU(2)$ transformation → Break $SU(2)$ to smaller gauge group.
- In our case, a_0 and Φ_i break the $SU(2)$ down to Z_2
→ Z_2 gauge theory which is gapped → Z_2 topological order.

Quasiparticle excitations in the Z_2 topological order

- The pure Z_2 gauge theory:
 - Z_2 charge e : boson.
 - Z_2 vortex m : boson.
 - e and m have mutual π statistics.
 - e - m bound state ϵ : fermion.

- Our Z_2 topological order = dressed Z_2 gauge theory, *which also has spin rotation, time reversal and all the lattice symmetry*:
 - Z_2 charge e : spin- $\frac{1}{2}$ fermion.
 - Z_2 vortex m : spin-0 boson (fermion).
 - e - m bound state ϵ : spin- $\frac{1}{2}$ boson (fermion).
- We have two possibilities: (2 bosons 1 fermion) or (3 fermions).

Quasiparticle excitations in the Z_2 topological order

- The pure Z_2 gauge theory:
 - Z_2 charge e : boson.
 - Z_2 vortex m : boson.
 - e and m have mutual π statistics.
 - e - m bound state ϵ : fermion.

- Our Z_2 topological order = dressed Z_2 gauge theory, *which also has spin rotation, time reversal and all the lattice symmetry*:
 - Z_2 charge e : spin- $\frac{1}{2}$ fermion.
 - Z_2 vortex m : spin-0 boson (fermion).
 - e - m bound state ϵ : spin- $\frac{1}{2}$ boson (fermion).
- We have two possibilities: (2 bosons 1 fermion) or (3 fermions).

The above is the history before 2000

(3 fermions) has a time reversal anomaly, and is not possible.

Examples of topological orders (after 2000)

To make topological order, we need to sum over many different product states, but we should not sum over everything.

$$\sum_{\text{all spin config.}} |\uparrow\downarrow \dots\rangle = |\rightarrow\rightarrow \dots\rangle$$

Examples of topological orders (after 2000)

To make topological order, we need to sum over many different product states, but we should not sum over everything.

$$\sum_{\text{all spin config.}} |\uparrow\downarrow \dots\rangle = |\rightarrow\rightarrow \dots\rangle$$

- *sum* over a subset of spin config.:

$$|\Phi_{\text{loops}}^{Z_2}\rangle = \sum \left| \text{loop config.} \right\rangle$$

$$|\Phi_{\text{loops}}^{DS}\rangle = \sum (-1)^{\# \text{ of loops}} \left| \text{loop config.} \right\rangle$$

$$|\Phi_{\text{loops}}^{\theta}\rangle = \sum (e^{i\theta})^{\# \text{ of loops}} \left| \text{loop config.} \right\rangle$$

- Can the above wavefunction be the ground states of local Hamiltonians?

Sum over a subset: local rule \rightarrow global wave function

- Local rules of a string liquid:

(1) Dance while holding hands (no open ends)

$$(2) \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right) = \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right), \quad \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right) \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right) = \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right)$$

$$\rightarrow \text{Global wave function } \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right) = 1$$

- Local rules of another string liquid:

(1) Dance while holding hands (no open ends)

$$(2) \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right) = \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right), \quad \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right) \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right) = -\Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right)$$

$$\rightarrow \text{Global wave function } \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \square \\ \hline \end{array} \right) = (-)^{\# \text{ of loops}}$$

- Two topo. orders: Z_2 topo. order Read-Sachdev PRL 66, 1773 (91), Wen PRB 44, 2664 (91), Moessner-Sondhi PRL 86 1881 (01) and double-semion topo. order. Freedman etal cond-mat/0307511, Levin-Wen cond-mat/0404617

 \rightarrow open-string create a pair of topo. excitations at their ends.
- Fusion algebra** of string operators \rightarrow fusion of topo. excitations:
 $W_e^2 = W_m^2 = W_\epsilon^2 = W_e W_m W_\epsilon = 1$ when strings are parallel

Topological ground state degeneracy

- The $-U \sum_i Q_i$ enforce closed-string ground state.
- F_p adds a small loop and generates a permutation among the loop states $\left| \begin{array}{c} \text{loop} \\ \text{loop} \end{array} \right\rangle \rightarrow$ Ground states on torus $|\Psi_{\text{grnd}}^\alpha\rangle = \sum_{\text{loops}} \left| \begin{array}{c} \text{loop} \\ \text{loop} \end{array} \right\rangle$
- There are four degenerate ground states $\alpha = ee, eo, oe, oo$

- The four sectors do not mix.
- The states in the four sectors are **locally indistinguishable**.
- On genus g surface, ground state degeneracy $D_g = 4^g$

Double-semion model

Local rules:

Levin-Wen cond-mat/0404617

$$\Phi_{\text{str}} \left(\begin{array}{|c|} \hline \blacksquare \\ \hline \end{array} \right) = \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \blacksquare \\ \hline \end{array} \right), \quad \Phi_{\text{str}} \left(\begin{array}{|c|} \hline \blacktriangleright \blacktriangleleft \\ \hline \end{array} \right) = -\Phi_{\text{str}} \left(\begin{array}{|c|} \hline \blacksquare \blacksquare \\ \hline \end{array} \right)$$

- The Hamiltonian to enforce the local rules:

$$H = -U \sum_{\mathbf{i}} Q_{\mathbf{i}} - \frac{g}{2} \sum_{\mathbf{p}} (F_{\mathbf{p}} + h.c.),$$

$$Q_{\mathbf{i}} = \prod_{\text{legs of } \mathbf{i}} \sigma_{\mathbf{i}}^z, \quad F_{\mathbf{p}} = \left(\prod_{\text{edges of } \mathbf{p}} \sigma_{\mathbf{j}}^x \right) \left(- \prod_{\text{legs of } \mathbf{p}} i^{\frac{1-\sigma_{\mathbf{j}}^z}{2}} \right)$$

- Ground state wave function $\Phi(X) = (-1)^{X_c}$, where X_c is the number of loops in the string configuration X .

Emergence of fractional spin/statistics

- Why electron carry spin-1/2 and Fermi statistics?
- Ends of strings are point-like excitations, which can carry spin-1/2 and Fermi statistics?

Fidkowski-Freedman-Nayak-Walker-Wang cond-mat/0610583

• $\Phi_{\text{str}} \left(\text{string liquid} \right) = 1$ string liquid $\Phi_{\text{str}} \left(\begin{array}{c} \blacksquare \triangleright \triangleleft \blacksquare \end{array} \right) = \Phi_{\text{str}} \left(\begin{array}{c} \blacksquare \text{---} \blacksquare \end{array} \right)$

360° rotation: $\uparrow \rightarrow \uparrow$ and $\uparrow = \uparrow \rightarrow \uparrow$: $R_{360^\circ} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$

$\uparrow + \uparrow \equiv e$ spin 0 mod 1. $\uparrow - \uparrow \equiv em$ spin 1/2 mod 1.

• $\Phi_{\text{str}} \left(\text{string liquid} \right) = (-1)^{\# \text{ of loops}}$ string liquid $\Phi_{\text{str}} \left(\begin{array}{c} \blacksquare \triangleright \triangleleft \blacksquare \end{array} \right) = -\Phi_{\text{str}} \left(\begin{array}{c} \blacksquare \text{---} \blacksquare \end{array} \right)$

360° rotation: $\uparrow \rightarrow \uparrow$ and $\uparrow = -\uparrow \rightarrow -\uparrow$: $R_{360^\circ} = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$

$\uparrow + i\uparrow \equiv s_-$ spin $-\frac{1}{4}$ mod 1. $\uparrow - i\uparrow \equiv s_+$ spin $\frac{1}{4}$ mod 1.

Spin-statistics theorem

- (a) \rightarrow (b) = exchange two string-ends.
- (d) \rightarrow (e) = 360° rotation of a string-end.
- Amplitude (a) = Amplitude (e)
- Exchange two string-ends plus a 360° rotation of one of the string-end generate no phase.

\rightarrow **Spin-statistics theorem**

Statistics of ends of strings

- The statistics is determined by particle hopping operators

Levin-Wen cond-mat/0302460:

- An open string operator is a hopping operator of the 'ends'.
The algebra of the open string operator determine the statistics.

- For type- e string: $t_{ba} = \sigma_1^x$, $t_{cb} = \sigma_3^x$, $t_{bd} = \sigma_2^x$

We find $t_{bd}t_{cb}t_{ba} = t_{ba}t_{cb}t_{bd}$

The ends of type- e string are bosons

- For type- ϵ strings: $t_{ba} = \sigma_1^x$, $t_{cb} = \underline{\sigma_3^x} \sigma_4^z$, $t_{bd} = \sigma_2^x \underline{\sigma_3^z}$

We find $t_{bd}t_{cb}t_{ba} = -t_{ba}t_{cb}t_{bd}$

The ends of type- ϵ strings are fermions

Systematic theory of topo. orders from topo. invariants

Topological order describes the order in gapped quantum liquids.

We conjectured that 2+1D topological order can be completely defined via only two topological properties:

Wen IJMPB 4, 239 (90); Keski-Vakkuri-Wen IJMPB 7, 4227 (93)

- (1) Ψ_{grnd} = space of **locally indistinguishable (LI)** states

- Given $\Psi_1(z_i)$, \exists other LI $\Psi_2(z_i), \dots$

- Topo. degeneracy $D_g \equiv \dim \Psi_{\text{grnd}}$,
depends on topology of space

Deg.=1

Deg.=D₁

Wen PRB 40, 7387 (89), Wen-Niu PRB 41, 9377 (90)

- The notion of LI states is defined respect to the notion of **local operators**: symmetric function $O_\xi(z_1, z_2, \dots)$ which is non-zero only when $|\xi - z_i| < l$

$$\int \prod_i d^2 z_i \Psi_1^* O_\xi \Psi_1 = \int \prod_i d^2 z_i \Psi_2^* O_\xi \Psi_2, \quad \forall O_\xi$$

- Also known as **topological degeneracy**

The degeneracy is robust against any local perturbations

Topological invariants that define LRE and topo. orders

- (2) **Vector bundle on the moduli space**

- i. Consider a torus Σ_1 w/ metrics g_{ij} . ii. Different metrics g_{ij} form the moduli space $\mathcal{M} = \{g_{ij}\}$. iii. The LI states depend on spacial metrics: $\Psi_\alpha(g_{ij}) \rightarrow$ a vector bundle over \mathcal{M} with fiber $\Psi_\alpha(g_{ij})$.

Topological invariants that define LRE and topo. orders

- How to find the conditions,
beyond $S^2 = (ST)^3, S^4 = 1$?

Study topological excitations above the ground states.

ie consider vector bundle from the degenerate ground states on Σ_g with punctures (quasiparticles).

- In particular, the vector bundles from the degenerate ground states on $\Sigma_0 = S^2$ with punctures (quasiparticles)
 \rightarrow unitary modular tensor category theory (UMTC)

Category theory – a theory of relations (morphism)

- A category \mathcal{C} is a set $\{\alpha, \beta, \dots\}$ of objects, with morphism (relation) $\alpha \rightarrow \beta$:
 - Morphism $\alpha \rightarrow \alpha$ exists.
 - If morphisms $\alpha \rightarrow \beta$ and $\beta \rightarrow \gamma$ exist, \rightarrow morphism $\alpha \rightarrow \gamma$ exists.
- α is a simple object if, $\forall \beta, \alpha \rightarrow \beta$ implies $\beta \rightarrow \alpha$.
- Example I A category of set S :
 - An object = a subset: $\alpha \subset S$
 - Morphism $\rightarrow = \supset$: $\alpha \rightarrow \beta$ means α include β : $\alpha \supset \beta$
 - A simple object = one-element set.
if $\alpha \supset \beta$ implies $\beta \supset \alpha \rightarrow \alpha$ is an one-element set.

We obtain the notion of a single element (the building block) via the relations (the morphism).

How to measure the symmetry group of a quantum system, if all your probes respect the symmetry?

- Example II a symmetric quantum system:

- An object = the ground subspace of a symmetric H

- Morphism $\alpha \rightarrow \beta$ if $\hat{O}\alpha \supset \beta$.

α the ground subspace a symmetric H .

β the ground subspace a symmetric $H + \delta H$.

\hat{O} the time evolution operator.

- A simple object = an irreducible representation.

the ground subspace (the degeneracy) is robust against all symmetric perturbations δH .

- Composite object = reducible rep., accidental degeneracy.

- From the dimension of simple α , we get the dimension of irreducible representation. Not quit the symmetry group yet.

- For $SO(3)$ symmetry:

No morphism between (spin-1) and (spin-2) ground space.

A morphism from $(\text{spin-1} \oplus \text{spin-2})$ to (spin-2) ground spaces.

Add stacking \rightarrow Tensor (fusion) category theory

Add another probe: composition (ie stacking) of two systems

$H \otimes H' \rightarrow$ *Tensor category: a category with fusion $\alpha \otimes \beta$.*

In general **simple-object** \otimes **simple-object** = **composite object**.

For example: **(spin-1) \otimes (spin-2) = (spin-1 \oplus spin-2 \oplus spin-3)**

- **Fusion ring (Grothendieck ring)**: Fusion of simple objects

$$\alpha \otimes \beta = \gamma_1 \oplus \gamma_2 \oplus \cdots = \oplus_{\gamma} N_{\gamma}^{\alpha\beta} \gamma$$

- The fusion ring (ie $N_{\gamma}^{\alpha\beta}$) determine the symmetry group G , if G is simple or abelian.

Local and topological quasiparticle excitations

In a system: $H = \sum_{\mathbf{x}} H_{\mathbf{x}}$

- a particle-like excitation $|\Psi_{\text{exc}}(\xi)\rangle$: energy density ξ
gapped ground state of $H + \delta H_{\xi}^{\text{trap}}$

- **Local quasiparticle excitation:**

$|\Psi_{\text{exc}}\rangle = \hat{O}_{\xi} |\Psi_{\text{grnd}}\rangle$ created by local operator O_{ξ}

- **Topological quasiparticle excitation:**

$|\Psi_{\text{exc}}\rangle \neq \hat{O}_{\xi} |\Psi_{\text{grnd}}\rangle$ cannot be created by local operators O_{ξ}

Local and topological quasiparticle excitations

In a system: $H = \sum_{\mathbf{x}} H_{\mathbf{x}}$

- a particle-like excitation $|\Psi_{\text{exc}}(\xi)\rangle$: energy density ξ
gapped ground state of $H + \delta H_{\xi}^{\text{trap}}$

- **Local quasiparticle excitation:**

$|\Psi_{\text{exc}}\rangle = \hat{O}_{\xi} |\Psi_{\text{grnd}}\rangle$ created by local operator O_{ξ}

- **Topological quasiparticle excitation:**

$|\Psi_{\text{exc}}\rangle \neq \hat{O}_{\xi} |\Psi_{\text{grnd}}\rangle$ cannot be created by local operators O_{ξ}

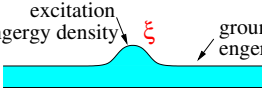

- **Topological types:** equivalent classes defined by local op. O_{ξ}

- if $|\Psi'_{\text{exc}}\rangle = \hat{O}_{\xi} |\Psi_{\text{exc}}\rangle$, then $|\Psi'_{\text{exc}}\rangle$ and $|\Psi_{\text{exc}}\rangle$ belong to the same type.
- if $|\Psi'_{\text{exc}}\rangle$ and $|\Psi_{\text{exc}}\rangle$ can deform into each other without closing the gap, then $|\Psi'_{\text{exc}}\rangle$ and $|\Psi_{\text{exc}}\rangle$ belong to the same type.

- **With symmetry** $\rightarrow O_{\xi}, \delta H_{\xi}^{\text{trap}}$ to be symmetric local operators.

Local and topological quasiparticle excitations

In a system: $H = \sum_{\mathbf{x}} H_{\mathbf{x}}$

- a particle-like excitation $|\Psi_{\text{exc}}(\xi)\rangle$: energy density  ξ ground state energy density
gapped ground state of $H + \delta H_{\xi}^{\text{trap}}$

- Local quasiparticle excitation:**

$|\Psi_{\text{exc}}\rangle = \hat{O}_{\xi} |\Psi_{\text{grnd}}\rangle$ created by local operator O_{ξ}

- Topological quasiparticle excitation:**

$|\Psi_{\text{exc}}\rangle \neq \hat{O}_{\xi} |\Psi_{\text{grnd}}\rangle$ cannot be created by local operators O_{ξ}

- Topological types:** equivalent classes defined by local op. O_{ξ}

- if $|\Psi'_{\text{exc}}\rangle = \hat{O}_{\xi} |\Psi_{\text{exc}}\rangle$, then $|\Psi'_{\text{exc}}\rangle$ and $|\Psi_{\text{exc}}\rangle$ belong to the same type.
- if $|\Psi'_{\text{exc}}\rangle$ and $|\Psi_{\text{exc}}\rangle$ can deform into each other without closing the gap, then $|\Psi'_{\text{exc}}\rangle$ and $|\Psi_{\text{exc}}\rangle$ belong to the same type.
- With symmetry** $\rightarrow O_{\xi}, \delta H_{\xi}^{\text{trap}}$ to be symmetric local operators.
- But there may be ground state degeneracy. $|\Psi\rangle$ and $|\Psi_{\text{exc}}\rangle$ should be ground subspaces, and they may have different dimensions.

Theory of topological excitations = category theory

- Local excitations: 1) Ψ_{exc} and Ψ_{grnd} are LI except near points ξ_I .
2) $\Psi_{\text{exc}}(\xi_1, \xi_2) = \text{ground subspace of } H_{\text{trap}} = H + \delta H_{\xi_1} + \delta H_{\xi_2}$.

Theory of topological excitations = category theory

“ \rightarrow ” (include) = *morphism in category*. $\Psi_{\text{trivial exc}} \leftrightarrow \Psi_{\text{grnd}}$
- Topological excitation** if cannot be created by local operators
(or $\Psi_{\text{topo. exc}}(\xi_1, \xi_2) \not\rightarrow \Psi_{\text{grnd}}$, $\Psi_{\text{grnd}} \not\rightarrow \Psi_{\text{topo. exc}}(\xi_1, \xi_2)$)
- Topological type** i = equivalence class of Ψ_{exc} : $\Psi_{\text{exc}} \sim \Psi'_{\text{exc}}$ iff
 $\Psi_{\text{exc}} \rightarrow \Psi'_{\text{exc}}$ and $\Psi'_{\text{exc}} \rightarrow \Psi_{\text{exc}}$ *isomorphic in category*
- simple type**: $\Psi_{\text{exc}}^{\text{simple}} \rightarrow \Psi_{\text{exc}}$ implies $\Psi_{\text{exc}} \rightarrow \Psi_{\text{exc}}^{\text{simple}}$
The subspace $\Psi_{\text{exc}}^{\text{simple}}(\xi)$ is robust against local perturbation near ξ .
- composite type**: $k = i \oplus j$, $i \rightarrow k$, $j \rightarrow k$.
The subspace $\Psi_{\text{exc}}(\xi)$ (degeneracy) can be splitted by local perturbation near ξ , ie contain accidental degeneracy.

$$\text{Fusion space} = \Psi_{\text{exc}}(\xi_1, \xi_2, \dots) = \mathcal{V}_{\text{fus}}(i, j, \dots)$$

Fusion ring of (non-Abelian) topological excitations

- For simple i, j , if we view (i, j) as one particle, it may correspond to a composite particle:

$$\mathcal{V}_{\text{fus}}(i, j, l_1, l_2, \dots) = \oplus_n \mathcal{V}_{\text{fus}}(k_n, l_1, l_2, \dots)$$

$$i \otimes j = k_1 \oplus k_2 \oplus \dots = \oplus_k N_k^{ij} k$$

→ the *fusion ring (Grothendieck ring)*.

- Associativity:**

$$(i \otimes j) \otimes k = i \otimes (j \otimes k) = \oplus_l N_l^{ijk} l, \quad N_l^{ijk} = \sum_m N_m^{ij} N_l^{mk} = \sum_n N_n^{jk} N_l^{in}$$

- Topologically protected non-local degrees of freedom:**

For simple quasiparticles, i, j, \dots , we cannot view their fusion space

$\mathcal{V}_{\text{fus}}(i, j, k, \dots)$ as $\mathcal{V}(i) \otimes \mathcal{V}(j) \otimes \mathcal{V}(k) \otimes \dots$, where the space $\mathcal{V}(i)$ describes the local degrees of freedom of the quasiparticle- i .

If so, we can add local perturbations near i to split the degeneracy.

For simple quasiparticles, the degrees of freedom described by their fusion space $\mathcal{V}_{\text{fus}}(i, j, k, \dots)$ are non-local and topologically protected.

Quantum dimension and “fractional” degree of freedom

Vector space fractionalization:

- In general, $\dim[\mathcal{V}_{\text{fus}}(i, i, i, \dots)] \neq (\text{integer})^n$.

Quasiparticle i may carry fractional degree freedom.

$$\dim[\mathcal{V}_{\text{fus}}(i, i, \dots, i)] = \sum_{m_i} N_{m_1}^{ii} N_{m_2}^{m_1 i} \dots N_1^{m_{n-2} i} = (\mathbf{N}^i)_{i1}^{n-1} \sim d_i^n$$

where the matrix $(\mathbf{N}^i)_{jk} = N_k^{ji}$, and d_i the largest eigenvalue of \mathbf{N}^i :

$$\dim[\mathcal{V}_{\text{fus}}(i, i)] = N_1^{ii}, \quad \dim[\mathcal{V}_{\text{fus}}(i, i, i)] = N_{m_1}^{ii} N_1^{m_1 i},$$

$$\dim[\mathcal{V}_{\text{fus}}(i, i, i, i)] = N_{m_1}^{ii} N_{m_2}^{m_1 i} N_1^{m_2 i}.$$

- d_i is called the *quantum dimension* of the quasiparticle i .
Abelian particle $\rightarrow d_i = 1$. Non-Abelian particle $\rightarrow d_i \neq 1$.

Theory of topological excitations = braided fusion category

- Above 1D, particles can braid \rightarrow unitary braided fusion category
- Braiding requires that
$$N_k^{ij} = N_k^{ji}.$$

Theory of topological excitations = braided fusion category

- Above 1D, particles can braid \rightarrow unitary braided fusion category

- Braiding requires that

$$N_k^{ij} = N_k^{ji}.$$

- Braiding \rightarrow **mutual statistics** $e^{i\theta_{ij}^{(k)}}$ and non-trivial fractional **spin** s_i

2π rotation of $(i, j) = 2\pi$ rotation of k

2π rotation of $(i, j) = 2\pi$ rotation of i and j and exchange i, j twice

$$e^{i2\pi s_i} e^{i2\pi s_j} e^{i\theta_{ij}^{(k)}} = e^{i2\pi s_k}$$

A unitary braided fusion category (UBFC) is a set of topological types with fusion and braiding, which is described by data (N_k^{ij}, s_i)

Relation between (S, T, c) and (N_k^{ij}, s_i, c)

Conjecture: A bosonic topological order [ie a non-degenerate UBFC \equiv an unitary modular tensor category (UMTC)] is fully characterized by data (S, T, c) or by data (N_k^{ij}, s_i, c) .

- From (S, T, c) to (N_k^{ij}, s_i, c) : E. Verlinde NPB 300 360 (88)

$$N_k^{ij} = \sum_l \frac{S_{li} S_{lj} (S_{lk})^*}{S_{1l}}, \quad e^{i2\pi s_i} e^{-i2\pi \frac{c}{24}} = T_{ii}.$$

- From (N_k^{ij}, s_i, c) to (S, T, c) :

$$S_{ij} = \frac{1}{\sqrt{\sum_i d_i^2}} \sum_k N_k^{ij} e^{2\pi i (s_i + s_j - s_k)} d_k, \quad T_{ii} = e^{i2\pi s_i} e^{-i2\pi \frac{c}{24}}$$

\rightarrow A theory of unitary modular tensor category (UMTC)

simplified theory of UMTC

Rowell-Stong-Wang arXiv:0712.1377

- The standard point of view:**

UMTC's are fully characterized by $(N_k^{ij}, F_{klm}^{ijm;\alpha\beta}, R_{k;\beta}^{ij;\alpha})$ (but not one-to-one). Conditions on those data + the equivalent relations

\rightarrow a theory of UMTC.

$\triangleleft \square \triangleright$ *hard to work with* 🔍 ↻

The relations between (N_k^{ij}, s_i, c) and (S, T, c)

- Number of particle types (dimensions of N_k^{ij}, s_i)
= ground state degeneracy on torus (dimensions of S, T).
Type- i particle is created as the end of type- i string operator, which also describe particle-anti-particle tunneling process.
- A particular ground state $|W_1\rangle$ on torus is obtained via the time evolution on space-time of a solid torus. Other ground state $|W_i\rangle$ is obtained by inserting a loop of type- i string operator W_i .

- S -matrix and link loops:

$$S_{ij} = \langle W_i | \hat{S} | W_j \rangle = Z \left(\text{link}(i, j, S^j) \right) = S_{ji}$$

Verlinde formula – The relations between N_k^{ij} and S

Witten CMP **121** 351 (89); Wang-Wen-Yau arXiv:1602.05951

- A surgery formula $\langle M_U | M_D \rangle \langle N_U | N_D \rangle = \langle M_U | N_D \rangle \langle N_U | M_D \rangle$

$$Z \left(\begin{array}{c} M_U \\ \hline M_D \end{array} B \right) Z \left(\begin{array}{c} N_U \\ \hline N_D \end{array} B \right) = Z \left(\begin{array}{c} M_U \\ \hline N_D \end{array} B \right) Z \left(\begin{array}{c} N_U \\ \hline M_D \end{array} B \right)$$

provided that the ground state degeneracy on the space- B is one.

- $\rightarrow \langle W_i | \hat{S} | 1 \rangle \langle W_i | \hat{S} | W_j \otimes k \rangle = \langle W_i | \hat{S} | W_j \rangle \langle W_i | \hat{S} | W_k \rangle$

$$Z \left(\begin{array}{c} S^3 \\ \hline i \end{array} \right) Z \left(\begin{array}{c} S^3 \\ \hline i, j, k \end{array} \right) = Z \left(\begin{array}{c} S^3 \\ \hline i, j \end{array} \right) Z \left(\begin{array}{c} S^3 \\ \hline i, k \end{array} \right)$$

where we have used the string operator algebra

$$W_j^{\text{str}} W_k^{\text{str}} = \sum_i N_i^{jk} W_i^{\text{str}} \rightarrow |W_j W_k\rangle = \sum_i N_i^{jk} |W_i\rangle.$$

- Verlinde formula: $\sum_l S_{i1} S_{il} N_l^{jk} = S_{ij} S_{ik}$

The relation between quantum dimension d_i and S

- $Z \left(\text{Diagram} \right) = S_{1i} = \langle W_{i \rightarrow \bar{i}} | W_{i \rightarrow \bar{i}} \rangle > 0$

- Let vector $\mathbf{v}_i = (S_{i1}, S_{i2}, \dots)$. Verlinde formula can be rewritten as

$$\mathbf{N}^k \mathbf{v}_i = S_{ik} \mathbf{v}_i, \quad \lambda_i^k = \frac{S_{ik}}{S_{i1}}$$

Since \mathbf{v}_1 has positive components, λ_1^k is the largest eigenvalue of $\mathbf{N}^k \rightarrow \frac{S_{1k}}{S_{11}} = d_i$. Using $\sum_i S_{1i}^2 = 1$, we find

$$S_{1i} = S_{i1} = d_i / D, \quad D^2 = \sum_i d_i^2.$$

The relation between quantum dimension d_i and S

- $Z \left(\text{Diagram of a sphere with a dashed horizontal line and a red arrow labeled } i \text{ on the left side, enclosed in a red circle} \right) = S_{1i} = \langle W_{i \rightarrow \bar{i}} | W_{i \rightarrow \bar{i}} \rangle > 0$

- Let vector $\mathbf{v}_i = (S_{i1}, S_{i2}, \dots)$. Verlinde formula can be rewritten as

$$\mathbf{N}^k \mathbf{v}_i = S_{ik} \mathbf{v}_i, \quad \lambda_i^k = \frac{S_{ik}}{S_{i1}}$$

Since \mathbf{v}_1 has positive components, λ_1^k is the largest eigenvalue of $\mathbf{N}^k \rightarrow \frac{S_{1k}}{S_{11}} = d_i$. Using $\sum_i S_{1i}^2 = 1$, we find

$$S_{1i} = S_{i1} = d_i / D, \quad D^2 = \sum_i d_i^2.$$

- We also find

$$Z \left(\text{Diagram of a sphere with a dashed horizontal line and a red arrow labeled } i \text{ on the left side, enclosed in a red circle} \right) = S_{1i} = \frac{S_{1i}}{S_{11}} Z(S^3) = d_i Z(S^3); \quad \text{Diagram of two circles labeled } j \text{ and } i \text{ with arrows, enclosed in a red circle} = \frac{S_{ij}}{S_{11}} = S_{ij} D$$

The relation between fractional spin s_i and T

- A particle is not an ideal point. It has internal structure. We can use the framing to represent the internal structure.

- (a) $e^{i2\pi s_i}$
- (b) $e^{-i2\pi s_i}$

The relation between fractional spin s_i and T

- A particle is not an ideal point. It has internal structure. We can use the framing to represent the internal structure.

- (a) $e^{i2\pi s_i}$
- (b) $e^{-i2\pi s_i}$

- \hat{T} is a 2π twist of the particle world line:

$$\hat{T}|W_i\rangle = e^{i2\pi s_i}|W_i\rangle$$

- But \hat{T} also change the metrics of the solid tours $\rightarrow i$ independent phase from the gravitational CS term $e^{i\frac{2\pi c}{24} \int M^2 \times S^1 \omega_3}$

$$\hat{T}|W_i\rangle = e^{i2\pi s_i} e^{-i2\pi c/24} |W_i\rangle$$

From (N_k^{ij}, s_i, c) to (S, T, c) – Graphic calculus

- $\text{Diagram 1} = e^{i2\pi s_i} \text{Diagram 2} = e^{i2\pi s_i} d_i$

- $\text{Diagram 3} = \frac{S_{ij}}{S_{11}} = S_{ij} D$

- $\text{Diagram 4} \Rightarrow \text{Diagram 5} \quad \text{Diagram 6} \Rightarrow N_k^{ij} \text{Diagram 7}$

$$e^{i2\pi(s_i+s_j)} S_{ij} D = \sum_k N_k^{ij} e^{i2\pi s_k} d_k$$

The above can be rewritten as

$$S_{ij} = \frac{1}{D} \sum_k N_k^{ij} e^{2\pi i(s_i+s_j-s_k)} d_k,$$

A relation between N_k^{ij} and s_i

Anderson-Moore CMP 117 441 (88); Vafa PLB 206, 421 (88)

$$\det(W_{i,jk}) = \det(W_{i,j}) \det(W_{i,k})$$

$$\det(W_{i,j}) = \prod_r \left(\frac{e^{i2\pi s_r}}{e^{i2\pi s_i} e^{i2\pi s_j}} \right) N_r^{ij} N_l^{rk},$$

$$\det(W_{i,k}) = \prod_r \left(\frac{e^{i2\pi s_r}}{e^{i2\pi s_i} e^{i2\pi s_k}} \right) N_r^{ik} N_l^{rj},$$

$$\det(W_{i,jk}) = \prod_r \left(\frac{e^{i2\pi s_r}}{e^{i2\pi s_i} e^{i2\pi s_r}} \right) N_r^{jk} N_l^{ri}.$$

$W_{i,j}$, $W_{i,k}$, $W_{i,jk}$ are diagonal with the dimension of the fusion space $\mathcal{V}_{\text{fus}}(i, j, k, l)$: $\sum_r N_r^{ij} N_l^{rk} = \sum_r N_r^{ik} N_l^{rj} = \sum_r N_r^{jk} N_l^{ri}$

$$\rightarrow \sum_r V_{ijkl}^r s_r = 0 \pmod{1}$$

$$V_{ijkl}^r = N_r^{ij} N_{\bar{r}}^{kl} + N_r^{il} N_{\bar{r}}^{jk} + N_r^{ik} N_{\bar{r}}^{jl} - (\delta_{ir} + \delta_{jr} + \delta_{kr} + \delta_{lr}) \sum_m N_m^{ij} N_{\bar{m}}^{kl}$$

A simplified theory of UMTC based on (N_k^{ij}, s_i, c)

Wen arXiv:1506.05768

- Fusion ring:** N_k^{ij} are non-negative integers that satisfy

$$N_k^{ij} = N_k^{ji}, \quad N_j^{1i} = \delta_{ij}, \quad \sum_{k=1}^N N_1^{ik} N_1^{kj} = \delta_{ij},$$

$$\sum_{m=1}^N N_m^{ij} N_l^{mk} = \sum_{m=1}^N N_l^{im} N_m^{jk} \text{ or } \mathbf{N}^i \mathbf{N}^k = \mathbf{N}^k \mathbf{N}^i$$

where $i, j, \dots = 1, 2, \dots, N$, and the matrix \mathbf{N}^j is given by $(\mathbf{N}^j)_{ik} = N_k^{ij}$. N_1^{ij} defines a charge conjugation $i \rightarrow \bar{i}$:

$N_1^{ij} = \delta_{i\bar{j}}$. We refer N as the rank.

There are only finite numbers of solutions for each fixed N, D .

- N_k^{ij} and s_i satisfy $\sum_r V_{ijkl}^r s_r = 0 \text{ mod } 1$

$$V_{ijkl}^r = N_r^{ij} N_{\bar{r}}^{kl} + N_r^{il} N_{\bar{r}}^{jk} + N_r^{ik} N_{\bar{r}}^{jl} - (\delta_{ir} + \delta_{jr} + \delta_{kr} + \delta_{lr}) \sum_m N_m^{ij} N_{\bar{m}}^{kl}$$

This determines s_i to be a rational number. There are only finite sets of solutions.

A simplified theory of UMTC based on (N_k^{ij}, s_i, c)

From $(N_k^{ij}, s_i, c) \rightarrow (S, T)$

- Let d_i be the largest eigenvalue of the matrix \mathbf{N}^i . Let

$$S_{ij} = \frac{1}{D} \sum_k N_k^{ij} e^{2\pi i(s_i + s_j - s_k)} d_k, \quad D^2 = \sum_i d_i^2.$$

Then, S satisfies

$$S_{11} > 0, \quad \sum_k S_{kl} N_k^{ij} = \frac{S_{li} S_{lj}}{S_{1l}}, \quad S = S^\dagger C, \quad C_{ij} \equiv N_1^{ij}.$$

- Let $T_{ij} = e^{i2\pi s_i} e^{-i2\pi \frac{c}{24} \delta_{ij}}$ then $(SL(2, \mathbb{Z}) \text{ modular representation})$

$$S^2 = (ST)^3 = C.$$

- Let $\nu_i = \frac{1}{D^2} \sum_{jk} N_i^{jk} d_j d_k e^{4\pi i(s_j - s_k)}$. Then $\nu_i = 0$ if $i \neq \bar{i}$, and $\nu_i = \pm 1$ if $i = \bar{i}$.

All the topological order in the table can be realized in multilayer FQH systems

Levin arXiv:1301.7355, Kong-Wen arXiv:1405.5858

- Remote detectable = Realizable (anomaly-free):**

Every non-trivial topo. excitation i can be remotely detected by at least one other topo. excitation j via the non-zero mutual braiding $\theta_{ij}^{(k)} \neq 0 \rightarrow S_{ij} = \frac{1}{D} \sum_k N_k^{ij} e^{-i\theta_{ij}^{(k)}} d_k$ is unitary (one of conditions) \rightarrow the topological order is realizable in the same dimension.

- The centralizer of BFC $\mathcal{C} =$ the set of particles with trivial mutual statistics respecting to all others: $\mathcal{C}^{\text{cen}} \equiv \{i \mid \theta_{ij}^{(k)} = 0, \forall j, k\}$.

Remote detectable $\leftrightarrow \mathcal{C}^{\text{cen}} = \{1\} \leftrightarrow$ Realizable (anomaly-free)

Bosonic/fermionic topo. orders with/without symmetry

- “Topological” excitations with symmetry: Two particles are equivalent iff they are connected by **symmetric** local operators.

Equivalent classes = topological types with symmetry

- **Example:** for $G = SO(3)$:
 - Trivial “topological” types: spin-0. (centralizer=SFC)
 - Non-trivial “topological” types: spin-1, spin-2, $\dots \sim$ irreducible reps. (Cannot be created by local symmetric operators, but can be created by local asymmetric operators.)
 - Really non-trivial “topological” types. (Other types) (Cannot be created by local symmetric operators, nor by local asymmetric operators.)
- *How to classify topological orders with symmetry?*
How to classify fermionic topo. orders with/without symmetry?
Consider braided fusion category whose centralizer is non-trivial.
centralizer = symmetric fusion category (SFC) = symmetry

SFC = Exc. in bosonic/fermionic product states
with symmetry = a categorical description of symmetry

Symmetric fusion categories (SFC):

- For *bosonic product states*, 1) Particles are bosonic with **trivial mutual statistics (not remotely detectable)**;
2) Particles are labeled by irrep. R_i .

Topological types = irreducible representation $R_i \in \text{Rep}(G)$

The fusion and the trivial braiding of R_i define a special UBFC, called **symmetric fusion category (SFC)** and denoted as $\text{Rep}(G)$

SFC = Exc. in bosonic/fermionic product states with symmetry = a categorical description of symmetry

Symmetric fusion categories (SFC):

- For *bosonic product states*, 1) Particles are bosonic with **trivial mutual statistics (not remotely detectable)**;
2) Particles are labeled by irrep. R_i .

Topological types = irreducible representation $R_i \in \text{Rep}(G)$

The fusion and the trivial braiding of R_i define a special UBFC, called **symmetric fusion category (SFC)** and denoted as $\text{Rep}(G)$

- For *fermionic product states*, 1) Some particles are bosonic, and others are fermionic, and all have trivial mutual statistics
2) Particles are labeled by irrep. R_i . The full symm. group G^f contain fermion-number-parity $\hat{f} = (-)^{\hat{N}_f} \in G^f$.
 - Topological types = irreducible representation R_i (ex. spin- s)
The particle R_i has a Fermi statistics if $\hat{f} \neq 1$ in R_i (ex. spin-1)
The particle R_i has a Bose statistics if $\hat{f} = 1$ in R_i (ex. spin- $\frac{1}{2}$)
 - The fusion and bosonic/fermionic braiding of $R_i \rightarrow \text{SFC} = \text{sRep}(G^f) \equiv$

Classification of bosonic/fermionic topo. orders with symm.

Using the notion of centralizer: $\mathcal{C}_{\mathcal{C}}^{\text{cen}} = \mathcal{E}$, $\mathcal{E}_{\mathcal{C}}^{\text{cen}} = \mathcal{C}$.

Can UMTC_{/ \mathcal{E}} 's classify topological phases with symmetry/fermion?

Answer: **No**.

We also require the symmetry to be gaugable: **the UMTC_{/ \mathcal{E}} must have modular extension.**

Why do we require **modular extensions**?

- The symmetry G in a physical system is always twistable (on-site) *ie* we can always put the physical system on any 2D manifold with any flat G -connection, still with consistent braiding and fusion.

Why do we require **modular extensions**?

- The symmetry G in a physical system is always twistable (on-site) *ie* we can always put the physical system on any 2D manifold with any flat G -connection, still with consistent braiding and fusion.

Why do we require **modular extensions**?

- The symmetry G in a physical system is always twistable (on-site) *ie* we can always put the physical system on any 2D manifold with any flat G -connection, still with consistent braiding and fusion.

- We can add extra particles that braid non-trivially with the particles in SFC \mathcal{E} , and make the $\text{UMTC}_{/\mathcal{E}}$ \mathcal{C} into a unitary non-degenerate braided fusion category (ie an UMTC) \mathcal{M} .*

\mathcal{M} is called the modular extension of \mathcal{C} :

$$\mathcal{E} \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M}, \quad D_{\mathcal{E}}^2 D_{\mathcal{C}}^2 = D_{\mathcal{M}}^2$$

In \mathcal{M} , the set of particles that have trivial double-braiding with the particles in \mathcal{E} is given by \mathcal{C} . Using centralizer: $\mathcal{C}_{\mathcal{M}}^{\text{cen}} = \mathcal{E}$, $\mathcal{E}_{\mathcal{M}}^{\text{cen}} = \mathcal{C}$.

- Only $\text{UMTC}_{/\mathcal{E}}$'s \mathcal{C} that have modular extensions are realizable by physical 2D bulk systems (maybe with symmetry and/or fermion).**

2+1D fermionic topo. orders (up to $p + ip$) via (N_k^j, s_i, c)

Classified by **UMTC**/ \mathcal{E} 's with $\mathcal{E} = \{1, f\}$.

Distinct topo. phases with identical set of bulk excitations

In the presence of symmetry/fermion, there are distinct topological phases, such as SPT phases with the same symmetry, that have identical bulk excitations. But they have different edge structures.

- A $\text{UMTC}_{/\mathcal{E}} \mathcal{C}$ only describes the bulk excitations. But it can have *several different* modular extensions. \rightarrow Distinct topological phases with identical set of bulk excitations, but different edge structures.

The main conjecture:

Lan-Kong-Wen arXiv:1602.05946

- The triple $(\text{Rep}(G) \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M})$ classifies 2+1D bosonic topological phase with symmetry G .
- The triple $(\text{sRep}(G^f) \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M})$ classifies 2+1D fermionic topological phase with symmetry G^f .

From physical picture to mathematical theorem

- Stacking two topological phases a, b with symmetry G give rise to a third topological phase

$c = a \boxtimes_{\text{stack}} b$ with
symmetry G

c-TO

- For a fixed SFC \mathcal{E} , there exists a “tensor product” $\boxtimes_{\mathcal{E}}$, under which the triple $(\mathcal{E} \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M})$ form a commutative monoid

$$(\mathcal{E} \hookrightarrow \mathcal{C}_1 \hookrightarrow \mathcal{M}_1) \boxtimes_{\mathcal{E}} (\mathcal{E} \hookrightarrow \mathcal{C}_2 \hookrightarrow \mathcal{M}_2) \equiv (\mathcal{E} \hookrightarrow \mathcal{C}_3 \hookrightarrow \mathcal{M}_3)$$

- $\boxtimes_{\mathcal{E}}$ is different from the Deligne tensor product \boxtimes :

$$\begin{aligned} & (\mathcal{E} \hookrightarrow \mathcal{C}_1 \hookrightarrow \mathcal{M}_1) \boxtimes (\mathcal{E} \hookrightarrow \mathcal{C}_2 \hookrightarrow \mathcal{M}_2) \\ & \equiv (\mathcal{E} \boxtimes \mathcal{E} \hookrightarrow \mathcal{C}_1 \boxtimes \mathcal{C}_2 \hookrightarrow \mathcal{M}_1 \boxtimes \mathcal{M}_2) \end{aligned}$$

which has a symmetry $G \times G$. Need to be reduced to G (or \mathcal{E}).

- Lan-Kong-Wen [arXiv:1602.05936](https://arxiv.org/abs/1602.05936) has constructed $\boxtimes_{\mathcal{E}}$ using condensable algebra $L_{\mathcal{E}} = \bigoplus_{a \in \mathcal{E}} a \boxtimes \bar{a}$:

$$\mathcal{E} = (\mathcal{E} \boxtimes \mathcal{E})_{L_{\mathcal{E}}}^0, \quad \mathcal{C}_3 = (\mathcal{C}_1 \boxtimes \mathcal{C}_2)_{L_{\mathcal{E}}}^0, \quad \mathcal{M}_3 = (\mathcal{M}_1 \boxtimes \mathcal{M}_2)_{L_{\mathcal{E}}}^0$$

eg, \mathcal{M}_3 is the category of local $L_{\mathcal{E}}$ -modules in $\mathcal{M}_1 \boxtimes \mathcal{M}_2$

From physical picture to mathematical theorem

- $\{(\mathcal{E} \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M})\}$ describes topological phases with symmetry \mathcal{E} . Its subset $\{(\mathcal{E} \hookrightarrow \mathcal{E} \hookrightarrow \mathcal{M})\}$ describes symmetry protected trivial (SPT) phases, which forms an abelian group under the stacking.
- **For a fixed SFC \mathcal{E} , the modular extensions of \mathcal{E} form an abelian group.** $\boxtimes_{\mathcal{E}}$ is the group product, the Drinfeld center $Z(\mathcal{E})$ is the identity, and the “complex conjugate” is the inverse.
- A special case: $\{(\text{Rep}(G) \hookrightarrow \mathcal{M})\} = \mathcal{H}^3(G, \mathbb{R}/\mathbb{Z})$

From physical picture to mathematical theorem

- $\{(\mathcal{E} \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M})\}$ describes topological phases with symmetry \mathcal{E} . - A special case: $\{(\text{Rep}(G) \hookrightarrow \mathcal{M})\} = \mathcal{H}^3(G, \mathbb{R}/\mathbb{Z})$
- **The modular extensions of $\text{Rep}(G)$, $(\text{Rep}(G) \hookrightarrow \mathcal{M})$, classifies 2+1D bosonic SPT phases with symmetry G .**
- **The $c = 0$ modular extensions of $\text{sRep}(G^f)$, $(\text{sRep}(G^f) \hookrightarrow \mathcal{M})$, classifies 2+1D fermionic SPT phases with symmetry G^f .**
- There can be several topological phases that have identical bulk excitations. They are related by stacking SPT phases.

From physical picture to mathematical theorem

- $\{(\mathcal{E} \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M})\}$ describes topological phases with symmetry \mathcal{E} . Its subset $\{(\mathcal{E} \hookrightarrow \mathcal{E} \hookrightarrow \mathcal{M})\}$ describes symmetry protected trivial (SPT) phases, which forms an abelian group under the stacking.
 - **For a fixed SFC \mathcal{E} , the modular extensions of \mathcal{E} form an abelian group.** $\boxtimes_{\mathcal{E}}$ is the group product, the Drinfeld center $Z(\mathcal{E})$ is the identity, and the “complex conjugate” is the inverse.
 - A special case: $\{(\text{Rep}(G) \hookrightarrow \mathcal{M})\} = \mathcal{H}^3(G, \mathbb{R}/\mathbb{Z})$
 - **The modular extensions of $\text{Rep}(G)$, $(\text{Rep}(G) \hookrightarrow \mathcal{M})$, classifies 2+1D bosonic SPT phases with symmetry G .**
 - **The $c = 0$ modular extensions of $\text{sRep}(G^f)$, $(\text{sRep}(G^f) \hookrightarrow \mathcal{M})$, classifies 2+1D fermionic SPT phases with symmetry G^f .**
- There can be several topological phases that have identical bulk excitations. They are related by stacking SPT phases.
 - **All the modular extensions of a UMTC $_{/\mathcal{E}} \mathcal{C}$ are generated by $\boxtimes_{\mathcal{E}}$ ing with the modular extensions of \mathcal{E} :**

$$(\mathcal{E} \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M}) = (\mathcal{E} \hookrightarrow \mathcal{C} \hookrightarrow \mathcal{M}_0) \boxtimes_{\mathcal{E}} (\mathcal{E} \hookrightarrow \mathcal{E} \hookrightarrow \mathcal{M}')$$

Bosonic 2+1D SPT phases from modular extensions

- Z_2 -SPT phases:

$N_c^{ \Theta }$	D^2	d_1, d_2, \dots	s_1, s_2, \dots	comment
$2_0^{\zeta_2^1}$	2	1, 1	0, 0	$\text{Rep}(Z_2)$
4_0^B	4	1, 1, 1, 1	$0, 0, 0, \frac{1}{2}$	Z_2 gauge
4_0^B	4	1, 1, 1, 1	$0, 0, \frac{1}{4}, \frac{3}{4}$	double semion

- S_3 -SPT phases:

$N_c^{ \Theta }$	D^2	d_1, d_2, \dots	s_1, s_2, \dots	comment
$3_0^{\sqrt{6}}$	6	1, 1, 2	0, 0, 0	$\text{Rep}(S_3)$
8_0^B	36	1, 1, 2, 2, 2, 2, 3, 3	$0, 0, 0, 0, \frac{1}{3}, \frac{2}{3}, 0, \frac{1}{2}$	S_3 gauge
