Course Description

Health economics is a growing field and is an important aspect of public policy in developed and developing countries. This course is designed to introduce upper level undergraduate students in economics to the field of Health Economics. The provision and production of health care have different characteristics and incentives from other consumer goods making health related markets a unique topic for study. We will cover a number of topics including basic economic concepts important for the study in health economics, why health is different from other good, aspects of the US health care market, health care in other countries, health care reform, as well as discussing the importance of health for development and some basic economic evaluation techniques.

Course Organization

This course will follow a lecture format. Students are encouraged to ask questions on the course material and to share any personal experiences which are relevant to the topic.

Prerequisites

Econ 3070 (Intermediate Micro-Economics) is a pre-requisite for this course. Econ 3818 is recommended since an exposure to regression analysis will also be useful for understanding the material. Students who are unsure about their preparation for the course should speak with me.
