Jonathan Akins Campus Civil Engineer

Will Johnson Assistant Campus Civil Engineer

Dillon Thorse Intern Inspector - Outdoor Services

Stephen Frederick Jaeger Intern Inspector - Outdoor Services

INTRODUCTION

The UCB Outdoor Services group has been conducting pavement audits and associated MicroPAVER analysis, in conjunction with Borstad Consulting Services, since 2007. As of 2011 all analysis tasks were brought in-house to be conducted by the Facilities Management Civil Engineering group. This has allowed for personnel to maintain close contact with the audit team as well as saving the University money.

During the spring and summer of 2012 the campus saw a myriad of paving projects, as well as pavement upgrades associated with any of the number of capital construction projects in progress. These upgrades are ongoing, and while this year's audit reflects some of the upgrades, the majority won't become apparent until after next year's audits. That being said, the overall condition of the asphalt across all of main campus, east campus, the research park and south campus (excluding Parking and Transportation Services owned lots and Housing and Dinning Services owned streets and lots) has increased by 1%. This may seem insignificant, but it is important to consider that with no work would the overall quality of asphalt will deteriorate by approximately 3% per year. It is important to note that this increase is only in pavements audited during both 2011 and 2012 audits. A number of new areas were added (McAllister parking lot, Sybase parking lot, etc.) which have very low rated pavements and would skew the results if included in the above analysis.

A summary of recommended work resulting from a maintenance budget of \$150,000 per year is presented in the following document, in entirety in Appendix C and visually in Appendix D. While a larger budget would be required to maintain the progress seen in 2012, work associated with capital projects is expected to continue improving the overall quality.

METHODOLOGY

MicroPAVER utilizes data input from field investigations to predict pavement degradation and recommend maintenance practices. Maintenance is prioritized, based on a set budget, to retain the value of high quality pavements while repairing low quality pavements when budget allows. In order to accomplish this, a student audit team was assembled and trained to assess 19 different distress categories for each section of pavement. A section is defined as an area having similar characteristics such as construction date, traffic, type of construction, etc. For data collection sections are divided into samples that are generally 100 feet long and approximately 3,500 square feet or less. Then a random sample is chosen to represent the section, unless pavement conditions vary significantly within the single section. In that case additional sample(s) are audited for the single section in order to develop a more acceptable UCB Outdoor Services

condition index. Once data collection was complete analysis with MicroPAVER was run to determine current conditions as well as budget projections and maintenance recommendations. Analysis becomes more accurate as data for multiple years, as well as construction dates, are added to the database.

PAVEMENT INVENTORY

UCB Outdoor Services owns approximately 1,467,000 square feet of pavement on main campus, east campus, the Research Park and south campus. At a value of approximately \$6.50 per square foot the system has a total value of \$9.5 million. For analysis with the MicroPAVER software this pavement was divided into the following networks listed in Table 1.

Table 1: Network names and areas

Network Name	Area (Sq Ft)
East Campus	135,661
East Main Campus	264,853
West Main Campus	140,650
Research park	734,667
South Campus	76,321
Housing	9,308
Loading Docks	19,128
Parking Services	43,116
Grandview	42,701
Total	1,466,405

These areas are then further subdivided into 59 branches, based on location. Please see Appendix A for a full listing of branches and associated areas.

PAVEMENT MANAGEMENT

MicroPAVER and this pavement management plan are based on the deterioration curve shown in figure 1 below.

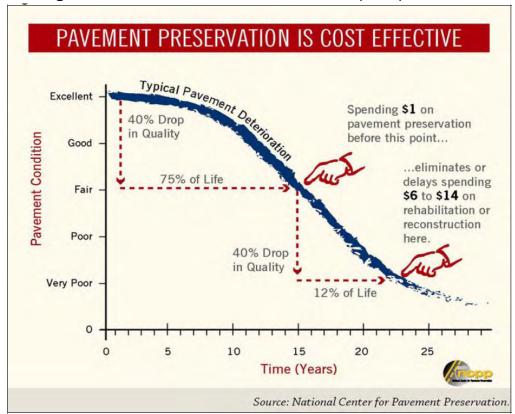

Figure 1: Standard deterioration curve for asphalt pavements

An excellent pavement has a pavement condition index (PCI) of 100 and a completely failed pavement has a PCI of 0. A critical PCI value occurs between 55 and 65. This is the point where pavement condition deteriorates rapidly. Figure 2 shows some examples of different pavement conditions ratings. Maintaining pavements above the critical value can result in a savings of 4-5 times, or more, in most cases. Due to this, the most effective way to maintain pavements, and the methodology that MicroPAVER analysis is based on, is to complete maintenance activities at or before the 40% drop in

quality. For example, an overlay costs significantly less than completely rebuilding a pavement section and a seal coat cost significantly less than an overlay.

Figure 2: Pavement condition

Good - Above critical condition

Failing - Critical condition

Failed – Below critical condition

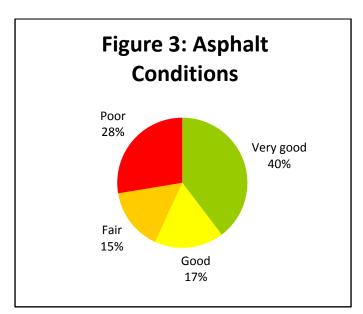

PAVEMENT CONDITIONS

Pavement audits were conducted for the entire University of Colorado, Boulder asphalt pavement inventory, including all areas listed in Table 1. Table 2 shows area-weighted average conditions for the entire system as well as for each network within the system. Appendix A shows even greater detail with conditions of each branch. Overall the campus has an average PCI of just under 60. This means, on average, campus asphalt has a critical PCI rating, which indicates that pavement deterioration is expected to accelerate over the coming years if steps aren't taken to increase the rating.

Table 2: Network Conditions

Network Name	Area (Sq Ft)	Average PCI
ALL	1,466,405	59.33
East Campus	135,661	66.71
East Main Campus	264,853	65.48
West Main Campus	140,650	67.82
Research park	734,667	59.91
South Campus	76,321	33.46
Housing	9,308	75.35
Loading Docks	19,128	75.08
Parking Services	43,116	44.07
Grandview	42,701	49.00

The overall percentages of pavement rated as very good, good, fair and poor are shown in Figure 3.

The audit has shown that 57% of UCB Outdoor Services asphalt surfaces are rated as good or very good condition. These pavements should only need routine preventative maintenance such as crack filling. 17% of pavements in the system are rated as good. These pavements are generally the best candidates for seal coating to prolong life. 15% of UCB Outdoor Services pavements are rated as fair condition. Pavements rated as fair may need additional crack sealing and patching. Fair pavements also generally benefit from slurry seal or mill and overlay work. 28% of UCB Outdoor Services pavements are rated as poor. These pavements are generally 20 years old or older and are failing at a quick rate, costing large amounts of money in maintenance and upkeep. This category of pavements tends to also present critical

safety hazards including potholes and rutting. Pavements rated as poor will likely require total reconstruction to bring their PCI to 100, although mill and overlay work may be appropriate on a case-by-case basis. See Appendix B for PCI values for each individual pavement section and Appendix D for a map showing areas and current pavement conditions.

FIVE YEAR MAINTENANCE PLAN

Based on the set budget of \$150,000 per year for asphalt upgrades, a 5 year maintenance plan has been developed. While this plan did not consider other budgets to a large extent it is important to note that even with a budget of \$150,000 overall asphalt conditions for the system will continue to decrease by a small amount. MicroPAVER analysis shows a required budget of approximately \$200,000 for condition stabilization while a budget of \$500,000 per year would allow the campus to increase its overall PCI rating by approximately 1 point per year. Maintenance plans for other yearly budget values are available upon request.

The set budget of \$150,000 will result in a decrease in overall PCI of approximately 0.5-1 point per year. This decrease is fairly small, and with the additional work generally provided by capital construction projects on campus it is quite possible to see an increase in pavement quality in the near future. For example, two failing sections of Kittredge Loop Road are planned for replacement with the Kittredge Central and Campus Utility System projects.

MicroPAVER has the ability to break up any set budget into 4 categories: stop gap, preventative, preventative & seal coat and major M&R. Stop gap maintenance entails primarily safety related maintenance such as pothole filling and minor skin patches and is only required for below-critical pavements(PCI 0-55). Ultimately areas flagged for stop-gap maintenance need to be replaced, but the budget being considered will not allow for the required major M&R. Stop-gap maintenance is not desirable and should be avoided if additional funding for major M&R is available. Preventative maintenance includes activities such as crack filling and very minor patching. Preventative maintenance is generally applied to high rated pavements in order to keep their condition rating stable. Preventative maintenance and seal coat is the preventative maintenance described above with the addition of a sprayed-on bituminous asphalt coating that seals the asphalt from the elements (fog seal) or a layer of aggregate covered in a sprayed-on bituminous asphalt coating (slurry seal). Fog seal is generally applied to asphalts experiencing primarily weather related distress while slurry seal can remedy more structural and use related distresses. These two maintenance practices can be applied to increase the condition rating of good and fair rated pavements. Major

M&R consists of mill & overlay maintenance work for higher rated pavements or total reconstruction for low rated and failed pavements.

For this analysis only "global" treatments were considered. Global is used in this context to represent work done to an entire section. This decision was based on the following factor: UCB Outdoor Services employs summer interns to conduct crack sealing and stop gap work it was not necessary to include these "local" maintenance activities. MicroPAVER has the tendency to chew through small maintenance budgets on these activities, while neglecting global maintenance, resulting in a less-than-useful maintenance plan. Therefore the maintenance recommendations, presented by section in Appendix C and visualized in Appendix D, only consider global maintenance. Stop gap maintenance should be carried out on all below-critical pavements and preventative maintenance should be carried out on all above-critical pavements as-needed on a yearly basis.

CONCLUSION AND RECOMMENDATIONS

Maintenance activities for 2013 have previously been determined as major M&R applied to the western portion of Kittredge Loop Rd. and a slurry seal applied to Colorado Ave. between the intersection with 18th St. and the info booth, as well as the portion of Libby Dr. west of Benson Earth Sciences. These are illustrated in Appendix D but are not portrayed in Appendix C. Maintenance recommendations, starting in 2014, are presented in Appendix C and call for extensive fog sealing in 2014, along with small amounts of slurry sealing and major M&R. MicroPAVER has determined, based on distress types and quantities from the past few years, that fog sealing is a better option for certain areas. Fog sealing is a cheaper alternative to slurry sealing and provides almost as much benefit, assuming distresses are more attributed to weathering. The 2014 plan also calls out some above-critical and critical areas for major M&R. Major M&R on these areas needs to be considered on a site specific basis. While major M&R generally consists of total reconstruction or mill and overlay work, it is possible that cheaper methods of M&R could be employed on some of these areas while still attaining a like-new condition.

In the following 4 years after 2014 MicroPAVER analysis recommends almost solely major M&R activities to bring critical pavements back to like-new conditions. This plan does not address some of the worst pavements on campus, instead opting to bring more of the almost-critical and critical pavements to like-new conditions.

By following these recommendations it is possible to reduce asphalt pavement deterioration to a rate of ~0.5% per year (without considering capital construction), as opposed to ~3% with no global maintenance. It is important that UCB Outdoor Services

continues to follow their preventative maintenance practice of crack-filling during the summer. Also, it is important to continue the summer asphalt audit program. Because environmental and usage related distresses are difficult to predict without local data, as more auditing data is added to the database the MicroPAVER program becomes increasing accurate.
