#### **Understanding the links between parental and adolescent substance use: complementary natural experiments using the children of twins design**

Rigorous evaluation of how parents shape their children's behavior has major implications for our understanding of family functioning and motivates policies or interventions promoting specific parenting practices. We propose examining the intergenerational impact of marijuana use and disorder using two complementary natural experiments in 6,457 individuals from 1,902 families in Colorado and Minnesota. We will use the children of twins design to test the extent of direct environmental impact of parents while controlling for genetic confounds, and conduct a state-by-state comparison of parental and adolescent marijuana use and disorder, parenting practices, and family environment, leveraging the marked differences in marijuana laws and substance use norms in Colorado and Minnesota.

**14/21 ABCD-USA consortium: research project site at CU Boulder**

The ABCD Study consortium uses multimodal brain imaging, cognitive and clinical assessments, bioassays, mobile monitoring, and careful assessment of substance use, environment, psychopathological symptoms, and social functioning in 11,878 9-10 year-olds to be followed over 10 years, to determine the effects of substance use on adolescent brain and cognitive development. This ABCD Research Project Site will follow and assess participants enrolled in the study. These data will be shared with the scientific community to address a comprehensive range of questions concerning youth development.

**Impact of marijuana legalization: comparison of two longitudinal twin cohorts.**  
Subcontract to Institute for Behavioral Genetics (**Hewitt**)

Legal recreational marijuana use has major public health implications. It is unknown, however, under legal recreational marijuana, how substance use patterns will change and what effects this will have on users. We will compare two large samples of twins, one in Colorado (a State with legalized recreational marijuana) and one with in Minnesota (a State with only very limited access for medical use), whose marijuana and other substance use patterns have been studied for over 15 years.

**Colorado Adoption/Twin Study of Lifespan Behavioral Development & Cognitive Aging Subcontract to Institute for Behavioral Genetics (Wadsworth)**

This unparalleled combined adoption/twin study will contribute to a greater prospective understanding of the manner in which cognitive abilities and physical health in early life mutually promote cognitive functioning as individuals approach midlife. An improved understanding of genetic and environmental influences and how they interact with early life factors to affect adult outcomes may contribute to improved cognitive and physical functioning and well-being, as well as to better health education and services.

**Neural Substrates of Executive Function: An fMRI Twin Study**

This research aims to conduct structural and functional MRI studies in 320 young adult twin pairs who have been studied longitudinally since infancy. Determining the extent to which functional variation in neural circuits supporting EF is itself heritable, or influenced by environmental factors, will provide information critical to understanding the role of neural circuits in mediating the genetic and environmental vulnerability to mental illness.
