

# Diploneis marginestriata

Hustedt 1922

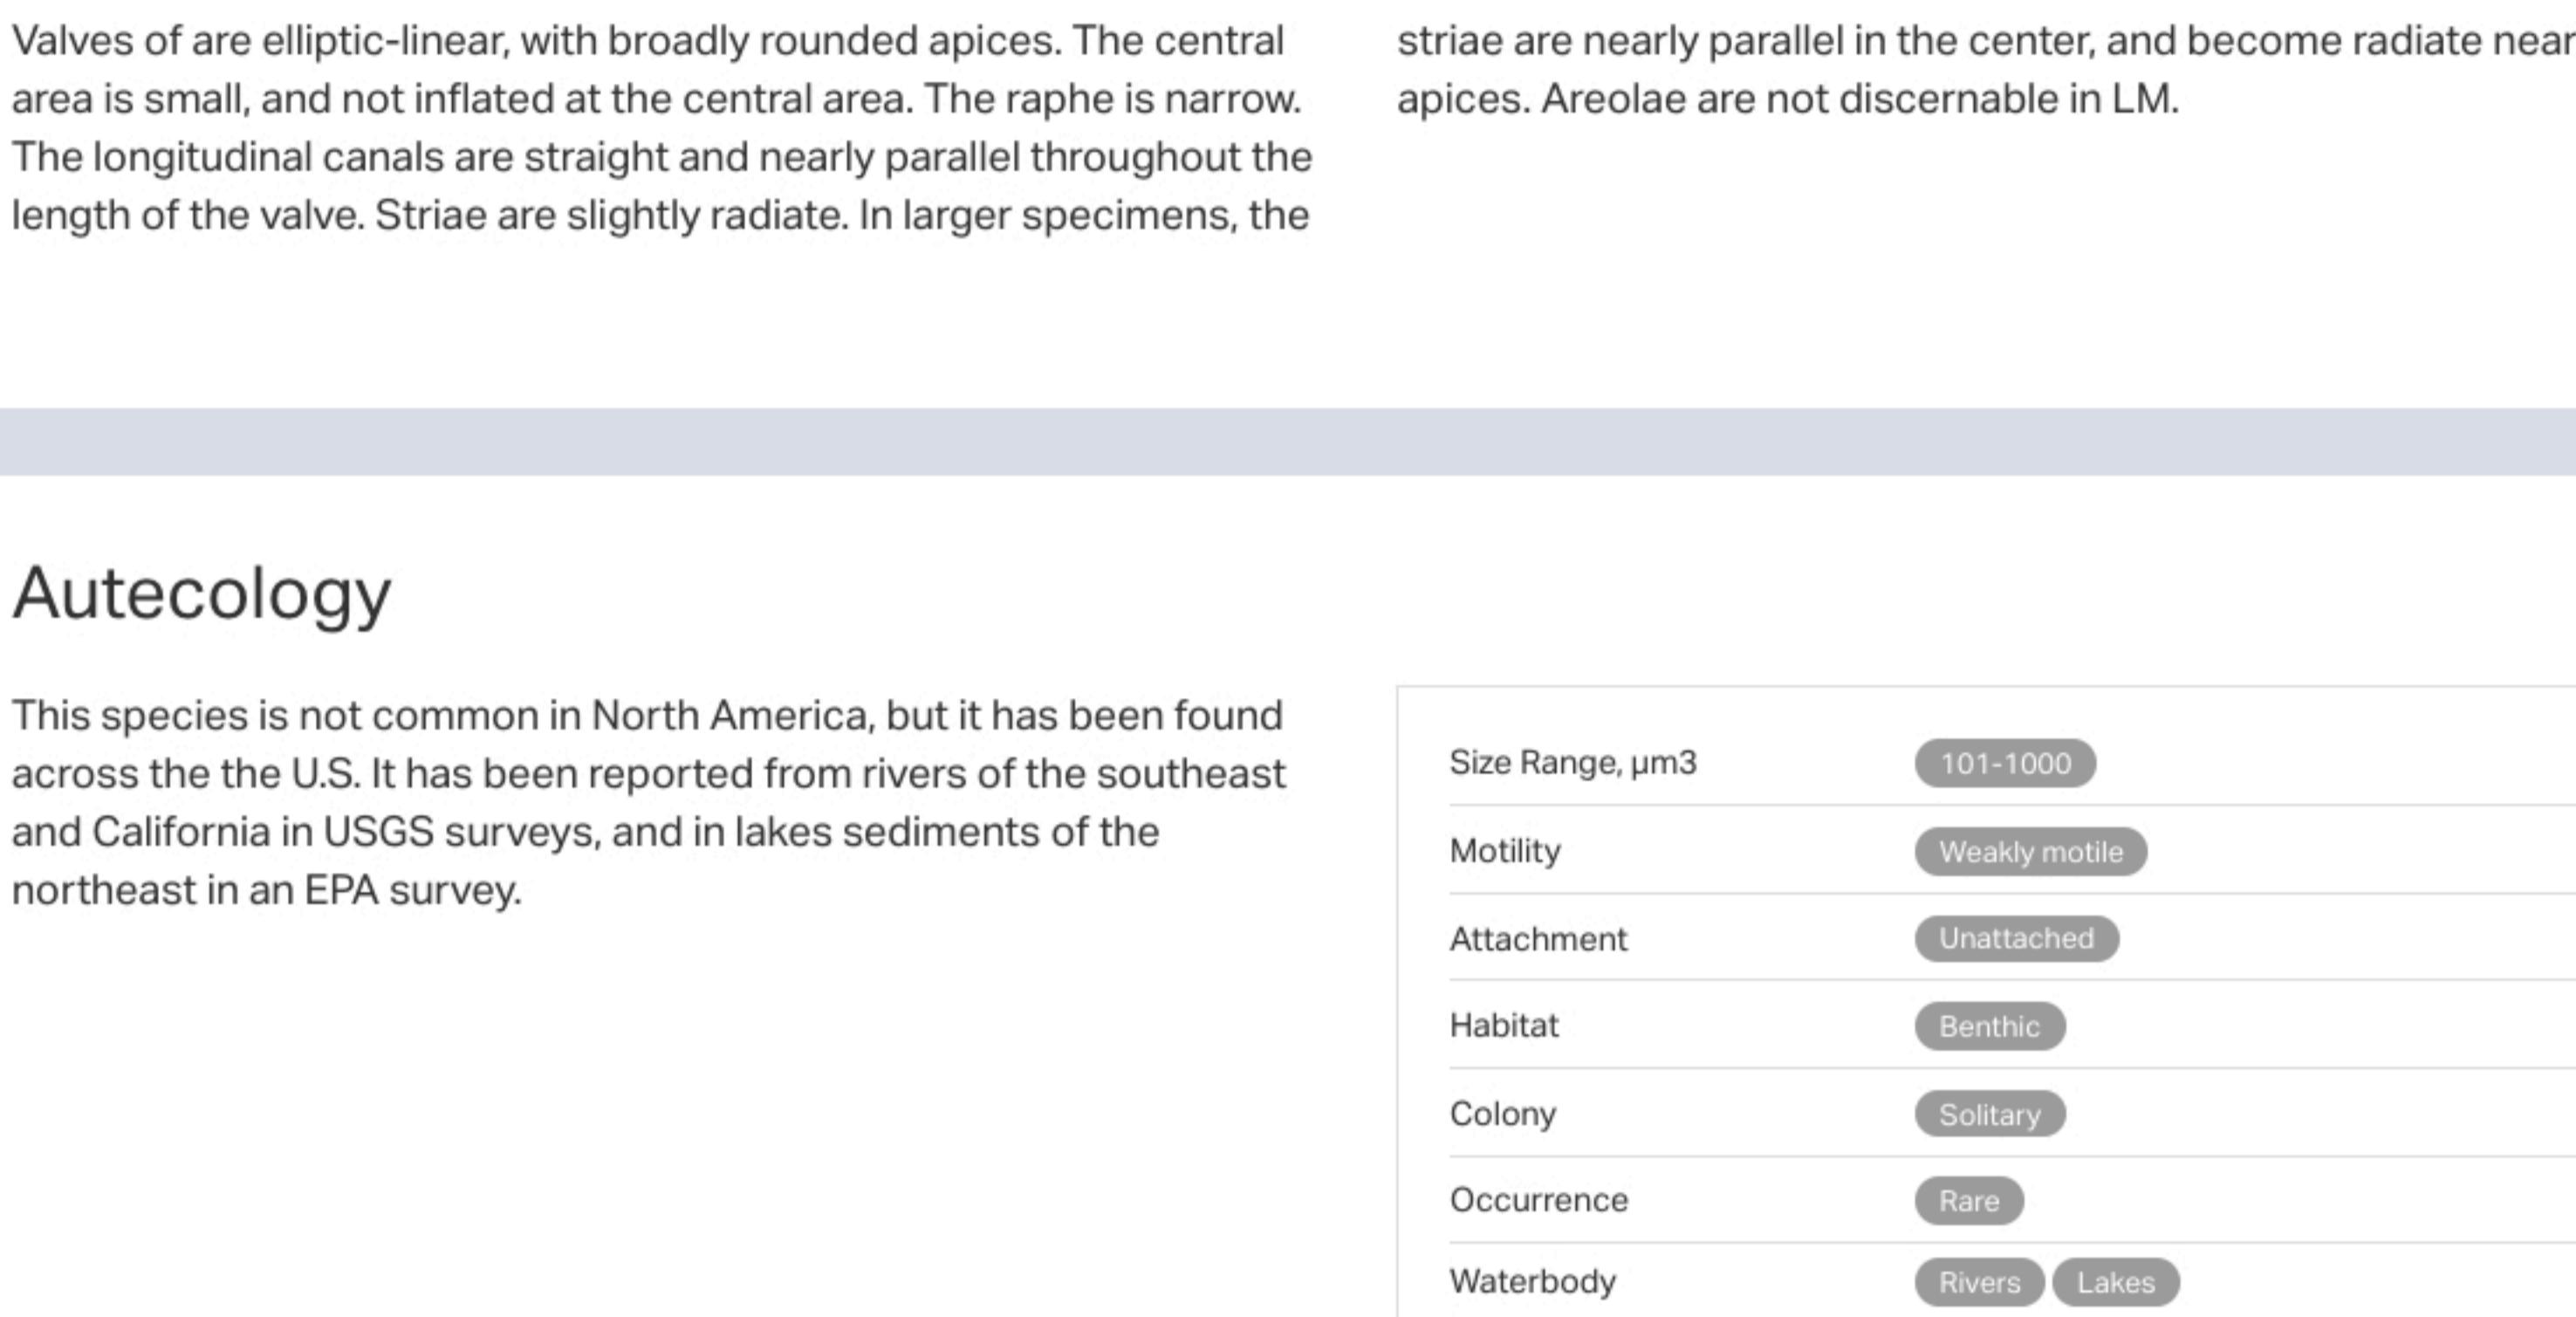

Category	Symmetric Biraphid
Length Range	12.2-23.3 $\mu$ m
Width Range	6.4-7.4 $\mu$ m
Striae in 10 $\mu$ m	18-19
Contributor	Melissa Vaccarino - Mar 2016
Reviewer	Sarah Spaulding - Mar 2018

## Identification

## Description

Valves are elliptic-linear, with broadly rounded apices. The central area is small, and not inflated at the central area. The raphe is narrow. The longitudinal canals are straight and nearly parallel throughout the length of the valve. Striae are slightly radiate. In larger specimens, the

striae are nearly parallel in the center, and become radiate near the apices. Areolae are not discernable in LM.

## Autecology

This species is not common in North America, but it has been found across the U.S. It has been reported from rivers of the southeast and California in USGS surveys, and in lakes sediments of the northeast in an EPA survey.

Size Range, $\mu$ m	101-1000
Motility	Weakly motile
Attachment	Unattached
Habitat	Benthic
Colony	Solitary
Occurrence	Rare
Waterbody	Rivers Lakes
Distribution	Southeast Survey California Northeast Lake Sediments

## Original Description

*Diploneis marginestriata* nov. spec. Tab. nostr. Fig. 5.

Schalen länglich-elliptisch mit fast parallelen Seitenrändern und breit abgerundeten Polen. Raphe gerade, mit voneinander entfernt stehenden Zentralporen. Hörner des Zestralknotens schmal, parallel laufend. Furchen breit, einen elliptischen Raum von 1/2-2/3 Schalenbreite einschließend. Sterifen randständig, leicht radial, etwa 20 in 10  $\mu$ , zart punktiert, am Innenrand der Furchen als zarte Strichreihe angedeutet.

Länge: 20-35  $\mu$ . Breite: 9-13  $\mu$ .

U.S. Im Vegetationsgürtel sehr selten, häufig dagegen in fast allen Schlammproben von 7-31 m Tiefe. Vereinzelt auch Algen im Kanal.

## Guide to *Diploneis marginestriata*

Hustedt 1922

## Compare

*Diploneis marginestriata* var. *minor* has a higher stria density and broader longitudinal canals.

LM scalebar = 10  $\mu$ m

Length Range: 12.2-23.3  $\mu$ m

Width Range: 6.4-7.4  $\mu$ m

Striae in 10  $\mu$ m: 18-19

① Valves narrow, linear

② Longitudinal canals linear

③ Central area nearly linear

Valves are narrow and linear. The longitudinal canals are linear, with no inflation, or only slight inflation, at the central area. Areolae are not discernible in LM.

## Also compare to

*Diploneis marginestriata* var. *minor*
