YouGov interviewed 905 Colorado adults who were then matched down to a sample of 800 to produce the final dataset. The respondents were matched to a sampling frame on gender, age, race, and education. The frame was constructed by stratified sampling from the 2018 American Community Survey (ACS) 1-year Colorado adult sample with selection within strata by weighted sampling with replacements (using the person weights on the public use file).

The matched cases were weighted to the sampling frame using propensity scores. The matched cases and the frame were combined and a logistic regression was estimated for inclusion in the frame. The propensity score function included age, gender, race/ethnicity, years of education, and region. The propensity scores were grouped into deciles of the estimated propensity score in the frame and post-stratified according to these deciles.

The weights were then post-stratified on 2016 Presidential vote choice, 2016 primary vote, bornagain status, and a four-way stratification of gender, age (4-categories), race (4-categories), and education (4-categories), to produce the final weight. Benchmarks for born again were obtained from the 2014 Pew Religious Life survey.

In an alternate weight, several likely voter profiles were given a slightly extra weight while unlikely voters were weighted down.
