### U-Pb Geochronology II High spatial resolution studies

#### John Cottle

Andrew Kylander-Clark & Bradley Hacker Dept. Earth Science University of California, Santa Barbara

#### Geochronologists are people, too...

#### Laser Ablation Inductively Coupled Plasma Mass Spectrometry (LA-ICPMS) systems

#### ion sources: inductively coupled plasma (ICP)

good: v. high efficiency; bad: large energy dispersion

#### Application of LA-ICPMS geochronology Key attributes:

- High spatial resolution
- Rapid data acquisition
- Petrochronology (e.g., Ti, REE, Hf, Nd)

### **Unprecedented Spatial Information**

zircon SIMS

zircon ICP

monazite ICP

#### **Rapid Acquisition**

75 min of LA-ICPMS data, including 15 I° standards, 15 II° standards, 70 unknowns

#### Petrochronology linking P, T, t, & D

#### Petrochronology linking date to P-T-X evolution

#### Instrumentation

# Petrochronology: Underlying Principles

- Fuse Petrology + Chronology
- chronometer of interest contains particular elements (e.g., zircon contains Lu, but not La)
- element—or group of elements—provides signature of another phase (e.g., Eu anomaly from feldspar)
- changes in trace elements driven by (dis)appearance of phases & *dT* & *dP*
- want fast grain-boundary diffusion & slow volume diffusion

# Zircon Petrochronology: REE Signature of Garnet

# Zircon Petrochronology: REE Signature of Garnet

↑P, T Garnet

# Zircon Petrochronology: REE Signature of Feldspar

P/TPlagioclase

# Zircon Petrochronology: REE Signature of Feldspar

**P**/T
Plagioclase

# Petrochronology examples

 Utilizing trace elements to understand complex metamorphic & magmatic histories
 → Pamir/Himalaya & Norway

Campaign style petrochronology
 → grain-, outcrop-, & orogen-scale

### Pamir, Domes & Xenoliths

# Pamir, Domes & Xenoliths

# Domes from Mid–Deep Crust

#### Pamir Domes: monazite

*Stearns et al., (2013)* 

#### **Pamir xenoliths**

 pieces of continental crust that reached UHT at mantle depths

- Implications for behavior of continental crust during collisional orogensis

Hacker et al., (2005)

# Tivs. U-Pb date

Pamir UHT, near-UHP xenoliths

# Tivs. U-Pb date

### Giant Norwegian UHP Terrane

![](_page_25_Figure_1.jpeg)

#### Eclogite ∇P: 1.8–3.6 GPa (65–135 km)

#### 1–2% eclogite & peridotite exposed over 30,000 km<sup>2</sup>

![](_page_26_Figure_2.jpeg)

Cuthbert et al. [2000]; Terry et al. [2000]; Wain et al. [2000]; Schärer & Labrousse [2002]; Carswell et al. [2003, 2006]; Labrousse et al. [2004]; Walsh & Hacker [2004]; Ravna & Terry [2004]; Root et al. [2005]; Young et al. [2007]; Butler et al. [2012]

#### *Eclogite* ∇*T*: 650−825 °*C*

![](_page_27_Figure_1.jpeg)

### Giant Norwegian UHP Terrane

- What is the timing and duration of UHP metamorphism?
- Were burial and exhumation rapid, or slow?
- Are UHP rocks within discrete blocks or are they a uniform package?

#### **Outcrop Relations**

# pegmatite zircon monazite titanite

eclogite • zircon • garnet • rutile

#### gneiss

- zircon
- monazite
- titanite
- rutile
- garnet

#### **Gneiss Into & Out of Eclogite Facies**

#### Monazite High Pressure gneiss, Norway

![](_page_51_Figure_1.jpeg)

#### Rutile Date + Temperature Map

![](_page_52_Figure_1.jpeg)

# **LASS Conclusions**

- rapid, high throughput
- in situ spatial precision: 7–30  $\mu m \ x \ 5 \ \mu m$
- 1–2% (2 $\sigma$ ) uncertainty U/Th-Pb dates
- can date 'difficult' minerals
- simultaneous dates, elements and isotope tracers, enables P-T-t-X-D

# What I didn't cover...

- apply LASS method to detrital accessory phases
- U-Th/Pb + trace elements + isotope tracers (Hf, Sr, Nd, Li etc.) to evaluate igneous systems
- Use LASS to screen accessory phases prior to high precision ID-TIMS analysis
